I recently downloaded the files PMP10.zip and PMPSRC.ZIP Both seem to be
corrupt, even PKZIPFIX doesn't help. Has anyone else had this problem?
I am very excited about this program and circuit and would like to learn more
so I am planning on getting a copy of the latest 73 mag.

My personal opinion is that if you want to plug an HDLC board into a PC, then there's very little reason to put a CPU on that board - just use the main processor. It's cheaper and much easier to program. A board like the PackeTen is great for standalone applications, but it's a waste to plug it into a PC - use DMA HDLC boards like the Packet Twin, the PI board or the DMASYNC, and run NOS on the PC.

This issue parallels a long raging debate within the regular Internet community about the usefulness (or uselessness) of communication coprocessors. Long and painful experience has shown that:

1. The host usually ends up speaking a protocol with the coprocessor that is at least as complicated as those the coprocessor is speaking to the outside world, thus canceling the main argument for the coprocessor in the first place (offloading the supposedly CPU-intensive protocol processing tasks from the main CPU.) Even if host/coprocessor communication were free, almost any meaningful application-level processing of a block of data will take many more CPU instructions than those required to run the TCP and IP protocols on the same block of data. "Offloading" the protocol processing to a coprocessor can therefore increase system performance by only a very small factor.

2. Coprocessors usually require highly specialized development environments that just aren't as complete or as available as those for general purpose systems. And they're often a pain to use, e.g., requiring the burning of EPROMs (or an EPROM simulator).

3. As a specialized niche market, coprocessors don't evolve as quickly or exploit economies of scale as quickly as mainstream CPUs. This can easily result in the absurd situation where a 33 MHz Intel 80486 spends most of its time idling, waiting for a 4 MHz Z-80 coprocessor to finish its task.

Many of these points are due to Van Jacobson of LBL, who has campaigned long and hard for keep-it-simple-stupid Ethernet interfaces. He gave an excellent tutorial on this theme at the 1990 SIGCOMM conference, perhaps he has made these points elsewhere by now.

I recently acquired a MFJ-1270B TNC 2 Packet Radio Controller.
The owner's manual I received does not contain a complete
description of the TNC commands supported by this device.

The level of firmware is:
      MFJ ENTERPRISES INC TNC-2
      AX.25 Level 2 Version 2.0 + FAX
      Release 1.2.7 10/13/90 - 32K RAM
      Checksum $75

The manual does not contain any information pertaining to
the mailbox,fax and bbs capabilities. I plan to write MFJ
requesting a newer owner's manual. But I would appreciate
it if anyone familiar with this equipment could send me a
brief description of the mailbox/bbs command set. I have
received mail (the STA LED is flashing) but I don't know
the command to read it.

Thanks,

Bill Plymale

I don't know whether it should belong here but anyway I downloaded the
files from csseq.cs.tamu.edu but encounter difficulties unzipping them.
I tried PKUNZIP, PKZMENU, and UNZIP and all reported faulty .ZIP files.
Is there something special about these files? I normally have no
problems unzipping files from Internet sites. Any suggestions?

Thanks in advance

I got a phone call from an excited AH6HU this morning. He said that U7MIR
called him on voice right after AH6HU had sent a connect packet to the PMS.
He went on to say that there would be a 70 degree pass at 11 pm (0900 Z).

At the predicted time, KA6NEI and I were pinging away on 146.55, and we
both managed to get a connect with the PMS. Half way through the orbit
(and in the middle of my attempt to upload a short message) U5MIR came up
on voice, saying "This is U5MIR." Both KA6NEI and myself managed to work
him on voice. I was on the phone with AH6IO in Waikiki at the time, and
he could hear U5MIR on a 2AT handheld with a rubber duck antenna!

So, looks like these guys are going to be on voice mode more often than
Musa (U2MIR) was, just like they said they would.

Oh, the equipment I used was: Yaesu FT727 HT, 20 watt "brick" amp, 110 feet
RG8X, and a vertical J-pole at 100 feet.

Sure is nice to live in Hawaii!

Aloha,
  John KJ9U

It's possible that the cosmonauts turned off the ham gear during
their rendezvous with the Progress M-8 supply rocket. This seems likely
in view of the near-miss that occurred with one of the previous supply rockets
a few months ago.

Bill, MFJ includes a FAST-START booklet which describes the commands added
since 1.1.4, which is where the owner's manual stops. Briefly, you enable
the mailbox with 'mailbox on' and read or process using the SYSOP command.
Use the H(elp) command to list the mbox commands, and exit with ^C.
'mailed on' will enable flashing STA when you have mail waiting.

This release (1.2.7) has a BUG in kiss mode that leads to random p-persistence
(slot values). If you plan to use KISS mode I recommend you replace the
eprom with TAPR 1.1.7b. You can ftp it, for example, from pc.usl.edu;
it's pub/ham/tapr117b.arc. But, you'll lose mailbox and fax capabilities.

73,

From several replies to my original posting, I now know
that I did not receive one of the manuals that should
have been included with the MFJ-1270B Packet Controller.

Thanks to those who responded so quickly. I have sent
a note to MFJ requesting the correct manual.

I'm glad to hear I'm not the only one with problems. Now that Guido has
confirmed my suspicions, I believe the files are corrupt. I've done ftp
before and I tried ascii,binary,tenex,etc. It doesn't work on any file
mode. I tried calling 73's BBS but the phone just rings. Anybody else
have a copy?

I am selling my IC-745 for $650. I haven't used for about half a year
and don't have time to ham as much as I'd like. This rig is
absolutely mint with very low transmit time. I baby'd it whenever I
used it, but I mostly used it for shortwave reception. Leave mail
if interested.

I am posting this query for a friend:

He has a 386 MSDos machine, and is a licensed HAM. He is quite a hacker, so
complicated scheme wouldn't intimidate him.

He would like to be able to log onto a Sparc on ethernet from his machine
in order to send/receive mail and read net news. He has yet to buy a packet
modem, so any info what modem to buy will also be appreciated.

Thank you for your help,
--Glenn Brown.

Hi there.

I know nothing whatsoever about packet radio. I'm interested in using it
to get an IP connection between two Unix machines, one at my home and one
at my work (about 5 city blocks distance).

Can someone please tell me where to find general information about packet
radio, where to get equipment, what sort of throughput and reliability I

can expect for what cost, etc.

Thanks much!

PMP is becoming a FAQ.

The latest version of Poor Man's Packet (August, 1991 _73_) can be snagged
via anonymous FTP from helios.tn.cornell.edu in /pub. There are two files:
pmp10.zip (executable and docs), and pmpsrc10.zip (full source code).
This host (helios) will always have the latest version of PMP.

Many people have been reporting the PMP .ZIP files on ccseq.cs.tamu.edu (?)
as corrupted. I suggest you try getting PMP from helios instead.

If you have any problems, questions, or suggestions: drop me e-mail.

Mea Culpa! Looks like the first set of files I put up for pmp were corrupt.
As of 2130 CDT they should be OK.

Anonymous ftp to csseq.cs.tamu.edu, directory ham-radio.

Please email willis@cs.tamu.edu if you have problems (or if it works!).

As an aside, we're trying to keep an assortment of ham related files on
that system. We currently have some ROSE s/w, as well as the current
question pool. The only version of NOS is one (slightly) modified to
support IP access control.
Suggestions/comments are welcome.

Cheers,
 Willis n5szf

I have recently changed os from MSDOS to a U*ix varient (coherent).

I am currently using kermit to interact with my tnc.
In order to log bbs listings to disk I use
     kermit clb /dev/com1l 1200 | tee <log file>

this seems to work ok ..
but come time to edit <lof file> and send a series of
read requests back to the bbs .. I have had no luck.

I have tried things like
cp <output file> /dev/com1l
cat <output file> > /dev/com1l

and all seem to be acceptable, but do not produce any
status change in the tnc.

Has anyone had any experience in this area and could perhaps
comment

Thanks

Stephen Pearce zl1any

Why not try anonymous FTP from helios.tn.cornell.edu

        /pub/pmp10.zip   Binaries and documentation
        /pub/pmpsrc10.zip   Complete source code (Turbo C 2.0)

I tried here the other day without any problems.

In surplus here we found a lot of cards for PC (ISA / AT Bus)
with 4 8530 , 80186 and 2*62256 static RAM .
I have not the card in my hands now but it has a model ACE+ .
It has also a USA telephone also that i dont have it now but i can
find it. If someone want it , ask for it.
I ask the local dealer ( they stop to support it now ) they told me
that they have drivers for 3 UNIX (sco,xenix and a another one)
for asy lines (terminals) not for packet ...
i have not the sircuit diagram but the 1488,1489 dos not support
a lot of lines i think.

I run a UNIX system at home, and I would like to have a process that
talks to my MFJ-1278 packet box and controls it. BBS services would
be nice, but currently I am trying to have it automatically contact
MIR and exchange messages.

What is the best way to do this? The basic command mode is not really
very computer friendly. Is there a mode that allow unambiguous and
straightforward decoding of events? What is KISS - does it help?

As you can see, packet is not something I am deeply involved in. Any
help would be appreciated.

There should be no problem IF things are set up correctly. I have noticed a propensity for users of KA9Q to add a host route for everyone they talk to. This is expedient but wrong and is the result of people assigning IP addresses without considering to which network (subnet) that user will belong.

Several years ago I constructed a very reliable IP-based network in the Washington, DC, area. I layed out the network and I assigned IP addresses on the basis of subnet. Each user required only two routes in order to reach every other reachable station: a network route to reach the other users in the subnet and a default route pointing to the router. It then became the job of the router to forward packets to the routers of other subnets so the packets could be delivered.

Packets were delivered with a probability of about 0.95. Email, file transfers, and keyboard-to-keyboard coexisted without ANY problems. (I even did an experiment where I ran three concurrent file transfers between three stations, all trying to transmit. The result was that all transfers completed in about the same amount of time indicating that the channel was being shared equally).

So, should you use IP or AX.25? Well, when you run IP your IP packets are encapsulated in AX.25 packets so you really have both. If your question is: should I run Phil Karn's KA9Q package to do IP or should I run some other packet program the answer is clear (to me). Run KA9Q because you can do IP and "ordinary" AX.25 at the same time.

I'm working on a fairly ambitious ham radio protocol package for Amiga.
I would like to add NET/ROM to it, but I cannot find any protocol
specification.
I know that NET/ROM is a commercial product, and that there are a couple
of free implementations around. But I don't want any source code, just a
pointer to a protocol specification.

Hello,

I heard that one can use packet radio or satellite to communicate with
others through computer + modem + small transceiver.

If this is true and someone know more about this please send me more
informations or the addresses where I can get more informations about
that.

I want to know about the satellites location, is it all over the world
or just for USA only. About the packet radio repeater, how to make/get
it, and how much it costs. And about the transceiver itself, the speed,
frequency band, cost, an d if possible the electronic scheme.

All helps will be appreciated.
Regards,
Nathan Madutujuh (MASTR15 at VTVM1, Virginia Tech, Struc. Eng.)

The question frequently comes up: "How do I get my Technician class ticket
(the one that doesn't require code tests)?"

The simple answer: "Call the ARRL at (203) 666-1541 and ask for their
Prospective Ham Package. They will take your adress and send you the
package customized for your zip code. It's not the most impressive package
I've seen, but it gives you a list of VEs in your area as well as
information on "What is Ham Radio?" and "How do I become a Ham?" and all
that."

The other simple answer: "Call the W5YI Group at (800)669-W5YI and ask for
their licence preparation material. I haven't had any contact with the
W5YI Group, but I'm told you get your ticket a little earlier when you take
your test at a W5YI session."

The more complicated answer: "You need to pass the Novice and Technician
theory tests at a VE session in your area. Talk to local hams (if you can
find them), check out your local ham store (if you can find one), or call
the ARRL. To get the study guides for the above tests, call the ARRL,
check out your local ham store, or go to Radio Shack for part numbers 62-
2410 and 62-2411. The Novice book will from Radio Shack will include morse
code practice tapes, and all of the study guides will probably indicate
that you need morse code for your Technician license, but don't panic! The
FCC only recently changed the rules (as of February 15, 1991), but you
don't need morse code for the Technician class ticket."

I have an Amiga 1000 with 512K ram and an external floppy disk drive. Is it
feasible to run packet TCP/IP with this configuration? I'm not interested in
having a pbbs or net/rom node running; I only want mail, ftp, telnet, and AX.25
capabilities. AmigaNOS v2.6 successfully loads but before trying any NOS
commands I discover I have problems moving the windows around on the screen
due to lack of memory (about 50K left). Does there exist a smaller version
of AmigaNOS?

This is an excellent topic dealt with by the lists of Frequently Asked Questions
for the amateur radio newsgroups. For rec.radio.amateur.misc (aka Info-Hams
Digest) they are written by Diana Syriac, KC1SP. They are posted on the
1st of each month, or you can get them from ftp.cs.buffalo.edu under
subdirectory /pub/ham-radio.

Questions about packet in general can be answered by Steve Schallen's FAQ
list for rec.radio.amateur.packet (aka Packet-Radio Digest) also due to
be posted soon and available via FTP.

This is a retransmission of a reply that I sent out on July 22, but
that for some reason or other failed to pass our local distribution
filter. I therefore suspect it was never distributed worldwide as
was the intention.

In <9107181354.AA12849@hermes.intel.com> rharel@fab8.INTel.COM (RICHARD HAREL)
writes:

>I recently saw info on "Pactor" - a new mode of digital communications

>The controller is called a "PTC" (Pactor terminal controller).
>I only have limited info on the new controller and would appreciate
>it if someone could post more information about Pactor to the net.
>73,
>Rich
>rharel@fab8%sc.intel.com

I should like to make clear that I have no experience with PACTOR
nor do I have any connection with the developers of PACTOR so what
I know is only what I have learned through the two articles that
have appeared in CQ-DL describing this new and exciting system.

The first article by Hans-Peter Helfert, DL6MAA, and Ulrich
Strate, DF4KV, "PACTOR - Funkfernschreiben mit Memory-ARQ und
Datenkompression", CQ-DL, November 1990, pp.706-709 gives the
theory behind the PACTOR system. They themselves describe it
as :

> 'PACTOR, a new Amateur ARQ System, combining advantageous
> features of both AMTOR and Packet Radio. A reconstruction
> method for unacknowledged packets (memory ARQ), an efficient
> data compression technique and dual speed operation provide
> a good data throughput even on noisy HF channels'.

PACTOR contains the following features:

- Memory-ARQ (Cumulative method for reconstruction of the
  original packets)

- online data compression (Huffman coding)

- faster and safer change over (Break-In)

- 100% ASCII compatible (Transmission of binary files)

- safer close down of transmission (Two-sided QRT)

- automatic mark/space detection (No fixed mark/space rule)

- optional connection to external frequency standard

- unambiguous addressing (Complete callsign)

- automatic selection of optimum transmission speed (100 and 200 Baud)

- powerful Listen Mode

- minimum hardware necessary

- comfortable operation

The transmission format is as follows:

Header : Data Field : Status : CRC

The header contains a constant bit pattern to ease synchronization in normal operation and in listen mode. This pattern is as well important for operation with Memory-ARQ.

The data field varies in length according to the transmission speed. At 100 Baud the data field is 10 bytes long (80 bits) while at 200 Baud it is 24 bytes long (192 bits).

The status or control byte contains a 2 bit packet number, Break-In or QRT request and transmission mode etc.

The CRC field contains a 16-bit block error detection code which will detect errors in the data field and status field.

PACTOR uses four control or receipt signals, CS1, CS2, CS3 and CS4. CS1 and CS2 are the normal control signals, while CS3 is the change over signal. These three signals correspond to the control signals used by AMTOR. CS4 in unique to PACTOR and it is used to ask the transmitting station to change transmission speed. The control signals are all of 12 bits length and have a Hamming distance of eight.

The receive interval between two packets or blocks are 320ms. Taking into account the time needed to transmit a control signal (120 ms) this leaves 200 ms for TX/RX change over and propagation delay, which should give sufficient reserve for DX contacts.

The automatic transmission speed change over is controlled by the receiving station. By reception of a faulty 200 Baud packet the receiving station can ask the transmitting station to lower the speed to 100 Baud. After correctly received 100 Baud packets the receiving station can ask the transmitting station to increase the transmission speed to 200 Baud. If the next 200 Baud packet is not acknowledged after a given number of trials the transmitting station will automatically lower the speed to 100 Baud.

The most interesting aspect of PACTOR is in my opinion Memory-ARQ. I will not go in details here, the interested reader should consult the original article and perhaps as well consult the given reference:

J.J. Metzner, D. Chang : 'Efficient Selective Repeat ARQ
Strategies for Very Noisy and Fluctuating Channels',
IEEE Transactions on Communications, Vol. COM-33, May 1985.

The idea behind Memory-ARQ is to memorize the signal at the output of the FSK discriminator. Normally the discriminator output is filtered and then sent to a slicer to produce a hard 1 or 0 value. The new idea with Memory-ARQ is to digitize the filtered discriminator output in an 8 bit ADC and store this value in memory. On reception of a repeat of a faulty packet the new values will be added to the old values such as to try to reconstruct the original information. It is clear that this should drastically reduce the number of repeats as the bit errors in the packets are likely to be randomly distributed.

The next article by Martin Clas, DL1ZAM, and Peter Mack, DL3FCJ, 'PTC - der PACTOR-Controller', CQ-DL, July 1991, pp.404-407 gives a description of the PTC hardware. The whole controller is fitted on a single card with a front panel card with all the control LEDs and a LED tuning indicator fixed to the mother card at one end. The unit is using a CMOS Z80 CPU and a Z80-STI multifunction chip. The design is neat, clean and appears to be well engineered. Apart from fully supporting the PACTOR mode the unit can also be used for AMTOR or normal RTTY. The AMTOR mode supports the ARQ, FEC and Listen modes and it can handle RTTY signals in the range from 30 to 300 Baud. The controller is complete with audio input, PTT control and AFSK or FSK output signals. The unit has no switches on the front panel, all commands are given via the RS-232 interface.

The PTC is available in kit form or as a cabled and tested unit. All enquiries about the kit or finished unit should be directed to Dr. Thomas Rink, DL2FAK, Roentgenstrasse 36, 6450 Hanau 1, Germany or to the authors of the PTC article, DL1ZAM and DL3FCJ. Please enclose a SASE with every letter.

Below follows the addresses for the four authors:

- Hans-Peter Helfert, DL6MAA,
  Gustav-Muller-Strasse 8, 8948 Mindelheim, Germany

- Ulrich Strate, DF4KV,
  Lommerwiese 18, 5330 Koenigswinter 1, Germany

- Martin Clas, DL1ZAM,
  Kreuzbergstrasse 24, 6457 Maintal 4, Germany

- Peter Mack, DL3FCJ,
  Im Bangert 21, 6450 Hanau 1, Germany

I hope this overview gave some information and did not create to much confusion. I sincerely hope that some of the original designers of PACTOR will take up the pen again and write a new article in an

English hamradio magazine. What about QEX?

Please pay attention, people. The bogus .NA addresses being talked
about have NO relation to the RFC822 mailers you all know and love.

These addresses are for use with a certain type of BBS package
used on amateur packet radio. Their close similarity to RFC822
address syntax is purely a mistake. No amount of headstanding
with MX records is going to solve the "gateway" problem, because
there IS no gateway problem. These are completely seperate networks.

Now, would all the people who refused to listen to some of us when
we said the RLI/MSYS syntax was only going to cause trouble please
line up against that concrete wall ... Once again, amateur radio
demonstrates its ability to be at the very trailing edge of technology.

An interesting little problem has popped up on internet having to do
with the use of the NA amateur radio packet domain being accidentally applied
to internet.

The following mail appeared in the usenet group comp.mail.headers:

From: ccfj@hippo.ru.ac.za (F. Jacot Guillarmod)
Newsgroups: comp.mail.headers,comp.mail.misc,comp.protocols.tcp-ip.domains
Subject: 'NA' country domain appears to be non-unique
Date: 27 Jul 91 20:30:37 GMT

The following article recently appeared in the infonets mailing list:
>Subject: ampr.org (digital radio internet) - totally separate?
> [a whole bunch of stuff deleted]
>-Jim Durham (durham@w2xo.pgh.pa.us) or packet-wise: W2XO@W2XO.PA.USA.NA

The interesting part for me is the '.NA' in the above signature.
Interesting because we are running a dialup uucp link to Namibia, which
has just got itself registered with the NIC, and I have already seen
quite a few non-obvious destinations passing through on this link.

Does anybody have any light to shed on this? Can anything be done to
tidy up?

[An interesting ergonomic side effect is the proximity of 'A' to 'Z' on
a standard keyboard, leading to typos that deliver mail for
'user@aukuni.ac.na' to Windhoek - eventually].

It was discussed in the group that this is amatuer packet radio traffic
and is not intended to be sent to NAmbia. (which is an official ISO
internet country designator) It was further learned that NAmbia is paying
a large price for each message that comes in and out of the country
and it is diligently bouncing all ill-addressed mail, but at a high
price. (something they want to stop doing)

In a request for assistance from NAmbia's postmaster, spel@hippo.ru.ac.za
(Dr. Eberhard W. Lisse), I sent him:

In comp.mail.headers you write:

>I am trying to find out who is in charge (postmaster) of this packet

>radio network to contact him to find ways to sort this out. This
>should be the proper way. They should register a top level domaine
>with sri.nic.mil or make the gateways rewrite their headers or
>something...

There is really no postmaster for the packet radio network. Let me explain how this naming scheme came about. The packet radio network is an international network of amateur radio BBS systems. Just like internet evolved hierarchical naming schemes, so did amateur packet radio. Mail messages that go over the packet radio network do not use standard RFC822 headers and do not conform to any Internet mailing system, they just look the same.

Currently, amateur radio is not connected with Internet in any formal manner except a few people who are experimenting with gateways. In the future, this connection will surely increase. Amateur packet radio already has a Internet domain of AMPR.ORG (net 44). Perhaps this will provide a solution for the gatewaying problem.

>the packet radio network in the USA has an INTERNAL domaine NA for
>North America. If someone mails INSIDE the packet network it goes
>without problems. Unfortunately the gateways do not rewrite the
>headers to something sensible and then the users REPLY to the From:
>address.

The packet radio network is international. The NA as you have guessed does stand for North America. It is interesting to note that the .NA never was intended to be used anywhere but in the amateur packet radio BBS systems.

>postmaster@uunet.uu.NET knows about it. As far as I am concerned there
>is nothing wrong with MXing all NAmibias hosts individually at
>uunet.UU.NET. However they seem to be reluctant to do this on
>principal as NA is a legal, registered top level domaine and the
>packet net is not. It might happen quite quickly that our University
>finally signs an agreement and some more hosts get on the net. I
>really do not want to bother people at other hosts so much.

I think uunet is correct. The MX records would patch the problem temporarily, but it is not the final solution. In addition, for other reasons, the 2 character continent names in amateur packet radio is getting phased out in favor of 4 letter domain names. In the case of North America, it is changing from NA to NOAM. But, this is strictly voluntary, so the conversion is slow.

The word will have to be spread in the amateur packet radio community to make sure the names do not get propagated over.

Let me state that I am not any official in amateur packet radio nor am I a gateway operator nor a writer of amateur radio BBS software. However, I am an amateur radio operator with great interest in amateur packet radio as well as Internet.

I am willing to help you sort this problem out. If you could send me
the headers of the bounced mail files, I could post them to the
appropriate discussion groups and try to find you an answer.
I do think this problem can be solved in a manner that will please everyone
and I want to thank you for your cooperation on this matter.

-Steve Schallehn
 steve@matt.ksu.ksu.edu
 Kansas State University

The whole gateway question involved here is if any of the current
internet<--->packet gateways are allowing the BBS headers to slide
through in a Reply-to or a From header. Also, perhaps there should
be some disclaimer tacked on to gatewayed messages stating
what a proper return path should be.

Something to chew on.....

10th ARRL Amateur Radio
Computer Networking Conference
27-29 September 1991
Radisson Airport Hotel

San Jose, CA

The Northern California Packet Association (NCPA) is hosting this year's ARRL Computer Networking Conference and invites you to attend. Glenn Tenney, AA6ER, is the local conference chairperson.

Hams from around the world will be presenting papers on what they're working on in packet radio. The presentations and papers might cover any subject from satellites to spread spectrum, from protocols to hardware, or any other topic related
to how hams are, or will be networking

In addition to the usual presentation of papers all day Saturday, this year's conference will be surrounded by other intersting and informative activities. See the agenda inside to see what we have planned for Friday and Sunday. You won't want to miss any of this. Send in the attached registration right now, and contact
the ARRL for an author's packet.

How to Submit Papers

The deadline for receipt of camera-ready papers is 12 August. If you're going to submit a paper, you should contact Lori Weinberg at ARRL, 225 Main Street, Newington, CT 06111, telephone 203-666-1541, fax at 203-665-7531. Lori is handling
the arrangements for the proceedings.

How to Register for the Conference

Please use the attached conference pre-registration form to register for the tutorials,
main conference, and the dinners. We are working with a VERY tight budget and would appreciate receiving your registration and check at the earliest possible date.
We have already had to make quite a commitment to the hotel, and catering is asking for a commitment which requires a close attendance count. Make your checks payable to "Fantasia Systems Inc." and mail them to AA6ER at: Glenn Tenney, AA6ER; Fantasia Systems Inc.; 2111 Ensenada Way; San Mateo, CA 94403 (the address is also on the form).

Hotel Reservations

We've arranged an attractive room rate of $69 per night, plus tax, for single or double occupancy. You'll have to make your hotel reservations early as the number of rooms blocked out for us is limited. Call the Radisson Hotel directly at (800) 333-
3333 to make your reservation. You'll need to tell them your reservation is for the
"ARRL CNC" to access our block of rooms. The way hotels work, it will help us meet our budget if our block of rooms is used up.

Transportation

The conference hotel is located near to the San Jose International airport which supports both commercial and general aircraft. The Radisson Hotel offers shuttle service to and from the airport. Be sure to ask about the shuttle service when you
make your hotel reservation.

In an effort to save you money, we've selected American Airlines as the official airline for the conference. What this means is that you can receive discount air fares (eg. from within the U.S., 5% off the lowest published applicable fare). You'll
have to contact American Airlines directly for details. Call their Meeting Services
Desk at (800) 433-1790 and refer to Star #S47Z14A. Since San Jose is an American Airlines' hub, you should find it very convenient.

The Agenda

We're still improving and tweaking the agenda, but here's the agenda as it stands right now:

Friday, 27 September

13:00 - 17:00: In-Depth Tutorials

Three concurrent in-depth technical sessions will be available. These planned "tutorials" are expected to include: Digital Signal Processing; Spread Spectrum and
Part 15; and Packet Satellites. The speakers selected will be those currently working
on the leading edge of these technologies. These sessions will allow the subjects to
be covered in depth and right down to the bits and bytes level. These sessions are
priced separately, and will include handouts and a mid-afternoon break.

19:00 - 21:30: Dinner

Instead of everyone trying to find a pizza place that can handle fifty or a couple of
hundred people, we've decided to have a very special group dinner. As an option you can sign up for the Friday evening dinner and join everyone for a LUAU! Yes, a real honest to goodness luau! This should be an ideal time for everyone to relax.
We expect that most of you will join us, even if you aren't attending the tutorials.
This will be right at the hotel, so you won't have to drive anywhere. After dinner
we expect to have some informal BOF sessions.

Saturday, 28 September

08:30 - 17:00: Presentation of CNC Papers

This is the traditional part of the conference. As in past years we'll be gathering up
all of the papers submitted for presentation, and divide them into the time available. Everyone will have a chance to present a paper. The published proceedings and lunch (at noon) are included in the conference fee.

18:30 - 21:00: Dinner

The CNC doesn't stop at dinner. We've arranged an optional dinner at the hotel complete with a guest speaker. At this time, we don't know who will be the banquet
speaker, but based on some of the names we're discussing, you won't want to miss this!

21:00 - 24:00: BOF sessions

Ten or fifteen minutes per paper really isn't enough, so we've planned break-out rooms for "Birds Of a Feather" sessions. During the day we'll have sign-up sheets so
that discussion groups can form and really get into topics of greatest interest.

Sunday, 29 September:

As usual, the digital committee will have their business meeting Sunday morning from 09:00 until 12:00. But that's not all...

We're going to have a demo room available from about 09:00 until 13:00. We're hoping that you'll be able to bring a rig with you to show off your latest work. We
may also have some exhibitors. But wait, that's still not all...

We're going to present various newcomer tutorials from 10:00 until 13:00. These tutorials may be for the first-time packet user, while others might be for the first-
time TCP/IP user. These tutorials will help folks learn more about various aspects
of packet radio. The demo/exhibit room and newcomer tutorials will be open to all hams and prospective hams whether signed up for the rest of the conference or not.

And finally, the San Jose Technology Center is a short light-rail ride away and they
have a fantastic high-tech museum called The Garage. Although a trip to the garage isn't an official part of the CNC, we're sure a large group will be planning a
visit on Sunday. We'll try to help plan this outing during the conference. We'll likely work out a late morning trip and an early afternoon trip.

There is an address block (44.193? I'm not sure.) assigned to AMSAT
for space operations. Maybe you could ask them for a temporary
address.

What would be far more convenient, though, would be an address from
the experimental block (I think 44.242). No coordination required,
and not much chance of an address conflict.

Would you be using TCP/IP to check into your home equipment? If
so, you would have to coordinate ahead of time in the "chase
states" so they could route you back home (this is assuming that
the IP community in those states is still using static routing).

That is a fine idea. Another way is to use the internet as a huge wormhole. Brian Kantor authored an RFC, rfc1226, about this. There is code in the hamradio directory at ucsd.edu to do this. It seems that the idea is taking off, so maybe ampr.org will be better connected faster than we think. Note that the RFC and the software on ucsd encapsulate AX.25 frames within IP packets. This means that you are not restricted to ampr IP traffic, you could even have normal keyboard to keyboard connections using this technique, or connect to distant netrom nodes, etc.

I'd be interested in receiving wiring information for the cable necessary to connect a MFJ 1270B TNC-2 to a Yaesu FT470. I have a diagram, but I find myself suspicious about the indicated capacitor value. Thanks for any help.

I tried to get Backtalk-200 running today without much luck. The program
doesn't install as clearly or as easily as the author pretends.

If anyone has had any luck getting this program running, please contact me by
email.

Thanks,

David

1.0 Basic Packet Radio Information

1.1 What is packet radio?

Packet radio is digital communications via amateur radio. Packet radio takes any digital data stream and sends that via radio to another amateur radio station. Packet radio is so named because it sends the data in small burst, or packets.

1.2 What is amateur radio?

Amateur Radio is individuals using specified radio frequencies for personal enjoyment, experimentation, and the continuation of the radio art. Amateur radio operators must be licensed by their government. In the United States, the Federal Communications

Commission issues amateur radio licenses. Normally, a test on operating practices, radio theory, and in some cases morse code proficiency test is administered. Amateur radio is not to be used for commercial purposes. Also, amateur radio operators are restricted from using profanity and using amateur radio for illegal purposes.

For more information on Amateur Radio in general, see the monthly frequently asked questions posting in rec.radio.amateur.misc.

1.3 Why packet over other digital modes:

Packet has one great advantage over other digital modes : automatic operation. Packet TNC's are very advanced as far as automatic control go. Just simply connect to the other station, type in your message, and it is sent automatically. Any packet TNC can be used a packet relay station, or a digipeater. This allows for greater range by stringing several stations in a row. On HF, this allows for contacts with stations normally not in propagation range.

Packet radio provides error free transmissions because of built in error detection schemes. If a packet is received, it will be correct.

Also, on VHF/UHF packet, packet operators are allowed to operate in automatic control mode. This means that you can leave your packet station on constantly. Other users can connect to you at any time they wish to see if you are home. Some TNC's even have Personal BBS's (sometimes called mailboxes) so other amateurs can leave you messages if you are not at home.

Another advantage of packet over other modes is the ability for many users to be able to simultaneously use the same frequency simultaneously.

1.4 What elements make up a packet station?

A TNC (Terminal Node Controller)
A TNC contains a modem to decode the audio signals into digital signals. It also contains a micro-computer handle to convert the digital signals into text that can be sent over a RS-232 port to the computer. The CPU also handles the protocol overhead of the packet station. When you send data, it takes the text, puts error checking on it (CRC) and also puts it in an envelope for sending. When receiving a signal, it takes it out of the envelope, and sends the message to the computer.

Computer or Terminal
This is the user interface. A computer running a terminal program or just a dumb terminal can be used. For computers, any

phone modem communications program can be adapted for packet use or customized packet radio programs are available.

A radio
For 1200 baud operation (normal user access), a standard voice radio can be used. For UHF or VHF packet, Narrow band FM is used, normally on simplex channels. For HF packet, 300 baud data is used over single side band modulation.

1.5 What do you mean we can all use the same channel?

Packet radio uses a protocol called AX.25. AX.25 specifies channel access (ability to transmit on the channel) to be handled by CSCA/CD ?????? (Carrier Sense Collision Avoidance / Collision Detect) If you need to transmit, your TNC monitors the channel to see if someone else is transmitting. If no one else is transmitting, then the radio keys up and the TNC sends it's packet. All the other stations hear the packet and do not transmit until you are done. Unfortunately, 2 stations could accidentally transmit at the same time. This is called a collision. If a collision occurs, neither TNC will receive a reply back from the last packet it sent. Each TNC will wait a random amount of time and then retransmit the packet again.

1.6 What is AX.25 ?

AX.25 (Amateur X.25) is the communications protocol used for packet radio. A protocol is a standard for how two computer systems are to communicate with each other, somewhat analogous to using business format when writing a business letter. AX.25 was developed in the 1970's and based of the wired network protocol X.25. Because of the difference in the transport medium (radios vs wires) and because of different addressing schemes, X.25 was modified. AX.25 also included a digipeater field to allow other stations to automatically repeat packets to extend the range of transmitters. One advantage of AX.25 is that every packet sent contains the senders and recipients amateur radio callsign, thus providing identification with every transmission.

1.7 Definitions: Commonly used terms in Amateur Packet Radio

HDLC : (High-Level Data Link Control Procedures) A standard for high level link control. (ISO 3309)

AX.25 : Amateur X.25 protocol. The basis of most packet systems. See section 1.6.

TAPR : Tucson Amateur packet Radio. Was the first group to create a packet radio TNC using AX.25. Soon a TAPR TNC became

cloned by many others. TAPR continues development of packet radio equipment.

digipeater : A packet radio station used for repeating packets. See section 3.3.1 for more information.

digi : Short name for a digipeater

NET/ROM : A scheme for packet radio networking. See section 3.3.3 for more information.

TCP/IP : Transmission Control Protocol/Internet Protocol. A set of utility programs used over AX.25. See sections 3.2 for more information.

KA9Q NOS : (KA9Q Network Operating System) A TCP/IP program originally developed by Phil Karn, KA9Q. Currently there are many different versions available. See section 3.2 for more information.

NODE : A network node. Often a network node running NET/ROM.

KA-Node : A simple networking scheme developed by Kantronics. See section 3.3.2 for more info.

CSCA/CD ???? : Carrier Sense Collision Avoidance / Collision Detect.

TNC : Terminal Node Controller. See section 1.4 for more information.

AMPR : An abbreviation for Amateur Packet Radio.

44 net : The class A network designator for TCP/IP amateur packet radio. All numerical TCP/IP addresses are in the format of 44.xxx.xxx.xxx.

ampr.org : The organization recognized on Internet for amateur packet radio TCP/IP.

2.0 Computing Network Resources for Amateur Packet radio . . . 1
2.1 What Newsgroups/mailing lists are available?. 1
2.2 What anonymous FTP sites are available 2
2.3 Are there any gateways for mail or news 2

2.0 Computing Network Resources for Amateur Packet radio

This section summarizes the resources available on Internet for
amateur packet radio operators.

2.1 What Newsgroups/mailing lists are available?

This is a list of all groups that regularly discuss amateur
packet radio. For newsgroups, subscribe to the group through use
of your news reader. For mailing lists, add a '-request' to the
end of the list name for subscriptions. For listserv groups,
send mail to 'listserv' at the node which contains the list. The
first line of the mail should be 'SUBSCRIBE groupname yourname'.
Send the command 'help' for more information.

rec.radio.amateur.packet (Newsgroup):
General discussions involving Packet Radio.

rec.radio.amateur.misc (Newsgroup):
General amateur radio discussion. Usually does not contain any
particular information about Amateur Packet Radio.

rec.radio.amateur.policy (Newsgroup):
Discussion of regulation policies regarding every aspect of amateur radio. Occasionally deals with polices of packet coordination and legal issues of packet radio.

rec.radio.swap (Newsgroup):
General for-sale for any radio equipment. Occasionally will have packet equipment for sale. Recommended location for any amateur packet radio for-sale items.

info-hams@ucsd.edu (listserv group):
A digest redistribution of the rec.radio.amateur.misc Usenet discussion.

packet-radio@ucsd.edu (listserv group):
A digest redistribution of the rec.radio.amateur.packet Usenet discussion.

hs-modem@wb3ffv.ampr.org (mailing list):
Discussion of high speed modems and radios available and future plans. Also includes discussion of networking using high speed modems.

tcp-group@ucsd.edu (mailing list):
Group discussion technical developments of TCP/IP over packet radio and use of the NOS TCP/IP programs.

gateways@uhm.ampr.org (mailing list):
Discussion of current gateways and future plans for gateways. May deal with sensitive internetworking issues.

For all lists at ucsd.edu, archives are kept of the discussions and maybe access via anonymous FTP to ucsd.edu. Some listserv groups also have archives. Send to the group's listserv 'help' for more information on commands. Digests for the ucsd.edu discussions are available. Send mail to listserv@ucsd.edu with the first line being 'longindex' for more information.

2.2 What anonymous FTP sites are available for getting packet radio information and programs:

This is not an inclusive list of FTP sites, but these sites carry a large portion of the programs available. Consult the Archie archive server for info on particular files. Send mail to archie@cs.mcgill.edu with the line 'help' for more information on archie file searches.

ucsd.edu : Primary distribution site of KA9Q's TCP/IP packages. Also, general packet radio information.

simtel20.army.mil: very large collection of amateur radio
software.

wuarchive.wustl.edu: Mirror site of Simtel20 archives. Easier to
use then the simtel20 archive.

2.3 Are there any gateways for mail or news between internet and
amateur packet radio?

Currently, there is no general use gateways between packet radio
or any other computer network. The primary problem with such
gateways is required content of amateur packet radio. Most wire
based networks do not have any rules on content (such as
profanity or business) like amateur radio does. Therefore, all
traffic destinated to amateur radio has to be hand filtered.

However, there are several experimental wormholes that are being
tested through Internet. See the discussion on the gateways
discussion group for more information.

3.0 Networking and special packet protocols. 1
3.1 Are there any other protocols in use other than AX.25? 1
3.2 What is TCP/IP? 1
3.3 Networking Schemes. 2
3.3.0 What are some of those other networking schemes?. 2
3.3.1 Digipeaters. 2
3.3.2 KA-Nodes 2
3.3.3 NET/ROM. 2
3.3.4 ROSE 3

3.0 Networking and special packet protocols

This is a sample of some of the more popular networking schemes available today. By far, there are more customized networking schemes used than listed. Consult your local packet network guru for specific network information.

3.1 Are there any other protocols in use other than AX.25?

AX.25 is considered the defacto standard protocol for amateur radio use and is even recognized by many countries as a legal operation mode. However, there are other standards. TCP/IP is used in some areas for amateur radio. Also, some networking protocols use other packet formats than AX.25.

3.2 What is TCP/IP?

TCP/IP stands for Transmission Control Protocol/Internet Protocol. This is commonly used over the Internet wired computer network. The TCP/IP suite contains different transmission facilities such as FTP (File Transfer Protocol), SMTP (Simple Mail Transport Protocol), Telnet (Remote terminal protocol), and NNTP (Net News Transfer Protocol)

The KA9Q NOS program (also called NET) is the most commonly used version of TCP/IP in packet radio. NOS originally was written for the PC compatible. However, NOS has been ported to many different computers such as the Amiga, Macintosh, Unix System V, and others. Smaller computers like the Commodore 64 and the Timex-Sinclar do not currently have version of NOS available.

3.3 Networking Schemes

3.3.0 What are some of those other networking schemes?

During the early days of amateur packet radio, it became apparent that a packet network was needed. To this end, the following packet network schemes were created.

3.3.1 Digipeaters

The first networking scheme with packet radio was Digipeaters. Digipeaters would simply look at a packet, and if it's call was in the digipeater field, it would resend the packet. Digipeaters allow the extension of range of a transmitter by retransmitting any packets addressed to the digipeater.

This scheme worked well with only a few people on the radio channel. However, as packet became more popular, digipeaters soon were clogging up the airwaves with traffic being repeated over long distances. Also, if a packet got lost by one of the digipeaters, the originator station would have to retransmit the packet again, forcing every digipeater to transmit again and causing more congestion.

3.3.2 KA-Nodes

Kantronics improved on the digipeater slightly and created KA-Nodes. As with digipeaters, KA-Nodes simply repeat AX.25 frames. However, a KA-Node acknowledges every transmission each link instead of over the entire route. Therefore, instead of an end-to-end acknowledgement, KA-Nodes allow for more reliable connections because acknowledgments only carried on one link. KA-Nodes therefore are more reliable than digipeaters, but are not a true network. It is similar like having to wire your own telephone network to make a phone call.

3.3.3 NET/ROM

NET/ROM was one of the first networking schemes to try to address the problems with digipeaters. A user connects to a NET/ROM as if connecting to any other packet station. From there, he can issue the NET/ROM commands to instruct it to connect to another user locally or connect to another NET/ROM. This connect then connect again means that to a user's TNC, you are connected to a local station only and it's transmissions does not have to be digipeated over the entire network and risk loosing packets. This local connection proved to be more reliable.

NET/ROM don't use all of the AX.25 protocol. Instead, they use

special AX.25 packet called Unnumbered Information (UI) packets and then put their own special protocol on top of AX.25. This is again used to increase efficiency of it's transmissions.

NET/ROM is a commercial firmware (software put on a chip) program that is used as a replacement ROM in TAPR type TNC's. Other programs are available to emulate NET/ROM. Among them are TheNet, G8BPQ node switch, and some versions of NET.

NET/ROM nodes, at regular intervals, transmit to other nodes their current list of known nodes. This is good because as new nodes come on-line, they are automatically integrated in the network, but if band conditions such as ducting occur, often unreachable nodes are entered into node lists. This causes the NET/ROM routing software to choose routes to distant nodes that are impossible. This problem requires users to develop a route to a distant node manually defining each hop instead of using the automatic routing feature.

3.3.4 ROSE

Rose is another networking protocol derived from X.25. Rose nodes have a static list of the nodes it can reach. For a user to use a ROSE switch, he issues a connect with the destination station and in the digipeater field places the call of the local rose switch and the distant rose switch the destination station can hear. Other then that, the network is completely transparent to the user.

The static routing tables ROSE uses ensures that packet routing does not use unreliable links such as NET/ROM suffers from. However, ROSE suffers from it's inability to change it's routing table as new nodes come on line. The operator must manually change every routing table, thus ROSE networks require greater maintenance times.

Nntp-Posting-Host: matt.ksu.ksu.edu

I hope most of you have been able to read my packet radio FAQ posting.

I intend the FAQ to grow by bounds in the next few versions. I
decided to put out version 1.0 in it's current status to try to get
some ideas from you net.readers.

I would like to have as many comments about the FAQ as possible in
order to see what else needs to be included. Right now on my
to-do list is to add:

A separate section with references (RTFM, right? :-))
A list of magazines with packet radio.
Organizations to join. (Newsletters, etc)
Coordination Groups and user groups in various areas. (I need help here)
Where to get IP addresses for AMPR.
More definitions as I find them.
More FTP sites/mailing lists.
Add info about the AX.25/IP packet wormholes through Internet.
Add more networking schemes like TexNet/Flexnet/Pack-ten. (I really
    need help on this since I have never used them.)
Add info on baycomm.
Info on modems.
Info on fast modems.
DX Cluster info. (Anyone have references in ASCII?)
Phone line vs. packet modems.
Packet BBS systems.

Now, what did I forget.... :-)

If anyone has any info that would help me out on any of the subjects,
I would be happy to have it. Also, if anyone would like to volunteer
to do any section, I will gladly include their submission.

Thanks.

X-Mailer: uAccess - Mac Release: 1.0.2

Hi all;

I want to connect a remote terminal via an asynchronous connection to a Novell 286 network. I am going to try to use PCAnywhere or NetRemote. Here's the catch: The asynchronous connection will be via Amateur Packet Radio. HAS ANYONE DONE THIS?

Here is the setup: Grade school Novell LAN with Macs and PCs located in Washington D.C. and a remote laptop PC located in Haiti. The connection will be via HF packet radio on the 20 Meter band. (I know that this is going to be painfully slow, but to people who have no phone, let alone running water, waiting for a message for a few minutes is not much of a sacrifice) This link will allow school children in Haiti and their counterparts here in the Washington D.C. area to communicate.

Since the school teachers are adept at using the Novell network, a connection from the network to the school children in Haiti will reduce teaching on this end. It also removes the radios from the users and thereby may prevent misuse, etc.

I have a few questions about the arrangements:

o If I have the TNC in KISS mode will this be transparent enough for the data communications to take place?

o Will PCAnywhere or NetRemote provide error correction procedures?

o Is there any portion of the headers of the Novell packets which would be considered "encoded" as far as Amateur Radio regulations are concerned?

o How much overhead is involved in the Novell headers and protocol?

What are your thoughts and ideas? PLEASE DIRECT RESPONSES TO THE REC.RADIO.AMATEUR.PACKET NEWSGROUP. TO REPLY DIRECTLY TO ME PLEASE SEND MAIL TO PSCS!JOHN@UU.PSI.COM (the john@pscsys.com may not work for another week.)

Thanks!

This should probably be a FAQ, and I'm sure it will start a flamefest,
but here goes anyway -

I'm a new packet user, and I'm trying to decide on the primary method
I'm going to use to talk to the rest of the world. As far as I can tell,
my two choices are straight AX.25 or TCP/IP. I'm having a hard time
figuring out which is best for me. Here's some background:

ME - I do Unix database administration and systems administration for a
living, so I'm not afraid to get down and dirty with software and/or
hardware. I have successfully implemented an early version of KA9Q
NOS for Unix.

STATION - my station right now is an HK-232 (PK232 clone) with the
PK232MBX option and the TAPR DCD State Machine, driving an ICOM 24-AT.
The computer is a Tandy 5000MC running SCO Unix. I can run DOS if I
have to, but would rather not. QTH is Issaquah, WA (about 20mi E of
Seattle).

As I see it, there are some advantages and disadvantages to either one.
Here's what I see:

TCP/IP

PROS
     Seems to be better on poor paths - ie, it will retry forever
     (this could also be a con :-))
     Will interface easily with my Unix mail system
     I understand the underlying protocol better (but NOT the
     routing stuff).
     I can send and receive mail directly, rather than through a
     packet bbs.
     Binary file transfers
CONS
     Routing seems to be problematic. For example, it appears that
     in this area, there is no domain name server, so I can hear
     people, and they can hear me (sometimes), but we can't carry
     on a two way conversation (of any sort) until I get added
     (by hand) to his routing tables.
     NO documentation
     Using digipeaters or nodes appears more difficult
     A LOT of people have told me how BAD TCP is (but never any
     real 'reasons').

AX.25

PROS
     The documentation is a bit better
     Packet BBS access is easier.
     Routing just sort of happens, with no effort on my part
CONS
     I have yet to figure out how to send and receive mail without
     using a Packet BBS.
     To interface mail with Unix mail, I'd need to write a lot
     of code.
     No (transparent) binary file transfers

Well, there's my list, and my dilemma. Right now, AX.25 will work for
me, and TCP won't, because of the routing troubles, I'm having. So,
I guess the bottom line is "Is TCP/IP worth the effort?". I'd
appreciate any comments folks have, or pointers to documentation (for
EITHER AX.25 or TCP), or whatever.

73!

>in each metropolitan area.

This has been proposed at various times over the last five years by others
and myself. The principal difficulty is the cost of putting anything in
geosync orbit -- the opportunities are nowhere near as frequent as LEO spots.
We could probably get away with some sort of a network based on a number of
LEO satellites, but I'm not too sure it would be any more cost effective.

There used to be a list of PBBS's regularly updated and distributed.
I remember a file called WW-LIST.ARC on simtel20. Now I can't seem to find
anything of the sort. I would really appreciate it if anyone could tell me
where I might go about finding a national (or at least Pennsylvania)
list of PBBS's.

This should be line any other mobile activity. I used the terms "chase" just
to connect it to the ballon activity at the same time. Making advance
arrangements to route packets is just not in the spirit of ham radio,
especially as it applies to emergency preparedness. This network should
ideally work no matter where everyone suddenly has to move off to in less
than an hour's notice. Mobile operation must be considered.

It isn't legal. Ham radio is being used in this example to support a normal business activity. In this case, the business activity is the running of a school LAN. The school should be persuing this with commercial communication vendors.

As quoted from <955@uswnvg.UUCP> by cjackso@uswnvg.UUCP (Clay Jackson):
+---------------
| This should probably be a FAQ, and I'm sure it will start a flamefest,
| but here goes anyway -
```

```
+---------------

Followups (including this one) now in r.r.a.packet, where they belong.

+---------------
|    Routing seems to be problematic.  For example, it appears  that
|    in this area, there is no domain name server, so I can hear
|    people, and they can hear me (sometimes), but we can't carry
|    on a two way conversation (of any sort) until I get added
|    (by hand) to his routing tables.
+---------------

They should run the modified KA9Q code.  We use G1EMM here, with both RIP and
RSPF routing.  RSPF is best suited for "star" network configurations, RIP for
straight node-to-node access over a local area.

+---------------
|    NO documentation
+---------------

Some out-of-date and less-than-perfect documentation, in the form of various
released papers.  Good luck finding them (but try ftp to ka9q.bellcore.com).

+---------------
|    Using digipeaters or nodes appears more difficult
+---------------

Again, try the G1EMM variant.  I can use "ax25 route add" to add an AX.25
digipeater route for a given AX.25 station.

Nodes are "more difficult", but only slightly.  Use the command "attach netrom"
to configure the NET/ROM emulator interface, then you can "route add" and "arp
add" NET/ROM node routes.  I usually set up arp routes for both when known,
then set the IP routing to use AX.25 for speed when a direct connection is
feasible and NET/ROM for indirect and higher reliability connections.  Also,
NET/ROM is essential for the longer distance contacts (e.g. if I want to ftp
something from N8EMR's BBS I can route to node CMHIP).

+---------------
|    A LOT of people have told me how BAD TCP is (but never any
|    real 'reasons').
+---------------

The IP protocols are designed for a full-duplex connection; they are extremely
slow when used in half-duplex mode (i.e. normal packet operation).  They are
also optimized for higher speed, so 1200 baud IP is even slower by comparison.
(I think someone was going to try 300 baud IP on 17 meters; my only response
to that is "gawwwwwwwd!".)

Also, the preferred AX.25 timing parameters for IP operation do NOT coexist
well with normal AX.25 PBBS traffic.  AX.25 and IP coexist on 145.01 here-
abouts, and it's a real problem when both kinds of stations are active at the
same time.  145.05, with the same traffic level but AX.25 and NET/ROM only, is
```

much more responsive; the same goes for the 144.99 and 145.75 IP channels.

```
+---------------
|    Packet BBS access is easier.
+---------------
```

A proper configuration makes access of both Ax.25 and IP PBBS systems easy.

```
+---------------
|    Routing just sort of happens, with no effort on my part
+---------------
```

I assume you mean PBBS routing. Not many AX.25 TNCs do automatic digipeater routing or remember previous digipeater routes (although many custom packet programs do).

```
+---------------
|    I have yet to figure out how to send and receive mail without
|    using a Packet BBS.
+---------------
```

Which kind of PBBS --- personal, or a standard PBBS using MSYS, W0RLI, etc.? It is possible to use "reverse forwarding" between personal PBBS systems and standard PBBSes, although not all PBBS sysops will do it (WA8BXN, author of MSYS, refuses to do reverse forwarding; considering the load on his PBBS as it is, I don't blame him).

```
+---------------
|    To interface mail with Unix mail, I'd need to write a lot
|    of code.
+---------------
```

Well, a little code. Pick up the MMDF docs from louie.udel.edu and make it a separate MMDF channel (you did say SCO UNIX). MMDF does the hard work.

```
+---------------
|    No (transparent) binary file transfers
+---------------
```

Several custom packet programs give you essentially transparent binary file transfers. Being used to passing binaries around by Unix mail myself, I would simply use uuencode/uudecode.

```
+---------------
| I guess the bottom line is "Is TCP/IP worth the effort?".  I'd
| appreciate any comments folks have, or pointers to documentation (for
| EITHER AX.25 or TCP), or whatever.
+---------------
```

If you have a well-organized and well-connected IP community or have enough interested hams to make one, *and* you have access to the most recent versions of the KA9Q software (preferably with the G1EMM or PA0GRI extensions), *and* you can coordinate a separate frequency for IP communications, use IP. If

not, stick with AX.25. (If there aren't enough interested hams, don't plan to cut out AX.25 entirely....)

One more possibility: if you want to use NET/ROM and don't want to use real NET/ROM or TheNET, you can run the KA9Q software with the AX.25 and NET/ROM interfaces configured and leave the IP interfacing off. I sometimes do this in order to monitor NET/ROM traffic on a frequency (if there's a lot of NET/ROM activity on an AX.25 frequency, it's almost as bad as combined AX.25 and IP activity). Certainly setting up the KA9Q software is easier than burning a PROM for TheNET.

And another: the MSYS PBBS software does AX.25, NET/ROM emulation, and IP emulation. A ham whose primary interest is AX.25 but wants to explore NET/ROM and IP might want to run MSYS instead of KA9Q... but MSYS is not as good for operation which is to be *primarily* IP. There's also the risk of being mistaken for a major PBBS.... :-)

All of the above is IMHO and based on events in northeast Ohio; your mileage will almost certainly differ.

More crap. The IP (and particularly TCP) algorithms are designed to accomodate
  a *large* range of latency and bitrates at the data-link layer. They work
  very well over several orders of magnitude in both speed an latency.
  From 1200 bits per second to well over 300Megabits per second. From
  a few seconds roundtrip time to a few dozen nanoseconds.

Does anyone have information relating to the use of RF
communications (particularily spread-spectrum) in a hosptial
environment? I'm particularily interested in:
     - potential for interference with patient-care equipment
     - susceptibility to EMI

I'm also interested to see if anyone has any experiece with the
current line-up of wireless networking products (NCR,Telesystems,
OCI,etc) in this environment or in industrial applications - sites
harsher than typical "open-offices". Any information (even mildly
related) related to these questions would be appreciated.

Perhaps more likely the problem is that IP is design for more bulkier data
than is typically the normal traffic now found on AX.25.

Where TCP/IP does not do so well is in things like one-character-at-a-time
type of traffic, such as telnet. There are ways to deal with this, but I
have forgotten the RFC number at the moment.

Sounds right, but... Pls explain... It seems that experience has shown that
full duplex operation improves SLIP (and any other serial asynchronous methods)
throughput, at least from what I've read.

The HST high speed modems provided 'full duplex operation' via the combination
of a 9600 BPS recieve (to the terminal) channel, and a 300 BPS send channel.

These apparently proved to be less than useful. Switching to a V.32 link,
which has 9600 tx/rx channels, performance was as expected given the data
rate.

What explains this? I suppose it's because there is a lot of bidirectional
data flow in an IP link, and that the amount of traffic sent is enough to
totally overwhelm the 300 BPS channel?

Given this, would a link, say with a 9600 channel, and a 56K channel be
somewhat limited by the 9600 channel?

Please, if you answer (and I hope you or someone will) conjecture on the
send/recieve ratios to acheive adequate throughput in a variety of diferent
environments (text terminal to host, Various Peer protocols, X, etc..)

For instance, I suppose there would be a constant baseline for the IP traffic,
and other low layer protocols. Then for 'typical' text terminal to host links
you might add x amount of bandwidth to either channel, and for an X based
traffic pattern, (assuming some typical number of windows and types of tasks)
it might be y amount.

So, it might be that a 2400BPS channel and a 9600BPS channel would able to
handle a certain traffic profile.

All just cranial onanism, to be sure, but if anyone is interested in such
a cyclical manipulation, respond :)

     Wait! We're comparing apples and oranges here. IP is a *datagram*
service, AX.25 is a *link layer* protocol. IP specifies the format of
packets in a best-effort (implied unreliable) network. AX.25 is a protocol
that provides reliable streams between two points.

     ANY protocol that operates in a character-by-character mode (where
there is a single packet exchange for each keystroke) will "not do so well".
Note that this mode is not a characteristic of TCP: try setting your PACLEN
on your TNC to 1 and you will have the same effect. Also, telnet has a
line mode that buffers typed characters localy until a full line is typed;

     Yes, that's true, and here's why. TCP uses acknowledgements to
ensure reliablility. This means that if you have data flowing downstream,
you have a stream of acknowledgements flowing back upstream to the sender.
Of course, the acknowledgements are much smaller than the data packets.
     Any protocol that uses acknowledgements is going to work better on
a full-duplex channel, including AX.25. The TNC 2 clones do full-duplex,
believe it or not. Grab your dual-band HT, find a buddy, and try it out.

Possibly. With simple data transfer protocols (X/Y/ZMODEM, Kermit) the upstream acknowledgement is typically very small: a few bytes. So for each 1K transmitted, you may get 1 byte worth of acknowledgement in the other direction.

With TCP, an acknowledgement is a full-blown IP/TCP packet, which at its smallest, is about 40 bytes long. Seven ACKs per second and you've filled up your 300 bps backchannel.

>Please, if you answer (and I hope you or someone will) conjecture on the
>send/recieve ratios to acheive adequate throughput in a variety of diferent
>environments (text terminal to host, Various Peer protocols, X, etc..)

Very tough question to answer for the general case. I started to think about it, but my brain began to hurt. Too many variables: MTU of the link (the maximum packet size), traffic patterns, etc.

Hello,
I'm trying to connect a pc running MSYS 1.11 to a pc running
KA9Q using SLIP.
I think I know quite a bit about MSYS and have it configured for a
1200 baud link. I have tried running MSYS on both systems and it
works great. I would like to run KA9Q at one end.
I remember someone else was working on this problem b4 and it would
be easier for me to ask then to figure it out.
I remember something about using Datagram mode in KA9Q's Net program
If you have tried the previous and got it working tell me how!
a copy of your autoexec.net would be helpful as the docs to KA9Q
are not that easy to understand.
I am using a Null-modem in the line between the computers.

I have had a lot of requests for information on how to use
the packet<->internet gateway on my packet (ax25) bbs.

Once again, here's how it works. I apologize a little for it
being somewhat crude, but it was a hack for the local guys that
grew...

1. To mail from the internet to the packet bbs network.

     Send mail to "bbs@w2xo.pgh.pa.us".
     Use the "Subject:" line as you normally would.
     Make the first line of the message just like you
          were typing a "send message" command line
          into your local bbs. ie;
          S[P,B] TOCALL@[BBS.HADR/DIST]<YOURCALL [$Bulletin ID]
     Enter the text of the message
     Put "/EX" starting at the first column of the next
          line following the message and signature.

2. To mail from the packet bbs network to a ham on the internet:

     Send packet mail to: HISCALL@W2XO.#WPA.PA.USA.NA
     One *very important* proviso: If I dont' have this
     [guy,gal]'s call in my alias file, I don't have the
     faintest idea how to mail it on the internet 8-) .
     Para-psych is not my field! Seriously, I am trying
     to build up an alias file, so if you have a ham call
     and an internet address, please send me both.

3. For those who aren't familiar with the packet bbs command syntax,
     here's a brief rundown...

        S[P,B] TOCALL@[BBS.HADR/DIST]<YOURCALL [$Bulletin ID]

     Refer to the example above ^ .

     The "S" means "Send a message"
     "P" means "Personal" (Can't be read by other users).
     "B" means "Bulletin".
     "TOCALL" is just the call of the ham to which the mail is going.

"BBS" is the call of the bbs that this guy/gal uses for a home.
"HADR" is the "heirarchial address" See example below...
"DIST" is a mailing list or distributin list. There are many
of these. "ALLUS" will send to the whole country.
"PANET" will send to Pennsylvania. "OKIPN" will
send to Ohio, Kentucky, and Indiana. You get
the idea.
"YOURCALL" is just that, your call.

The optional "Bulletin ID" is used only to uniquely identify
bulletins to avoid duplicate postings. It is entered with
a "$" followed (with no space) by a unique alphanumeric
combination. Custom is to start with your call.
Oh yes,..there *must* be a space after the "SP" or "SB" .

So, some examples (This is Unix! Whattd'ya mean *examples*?)

SP W6XXX@W7YYY.AZ.USA.NOAM<W3ABC

SB ALL@ALLUS<W4QQQ $W4QQQ12543

In the first example, the "AZ.USA.NOAM" means
"Arizona.United States of America.North America" .
The abbreviations for states are those used by the
post office. You don't always need the whole address.
However, if you want to use just the state, use a perios
on both sides ".OH.". ".EU" will work for European bbses,
"OC" (Oceana) for Australia, etc, SA for South America.
The idea is to source route the message to the right
geographic location where hopefully the bbs will be
known by call letters.

It is *very* important that you use the H address, as
nameserver service on 1200 baud ax25 is pretty slow and
my file of bbses by call is not nearly complete.

I probably left out something important. E-mail me
at "durham@w2xo.pgh.pa.us" if you have questions.

Consider that many hospital security personnel have HT's.

Actually, NOS (the newer version of Phil's software) has not been
ported to the Macintosh. The Mac version of the KA9Q package is based
on NET, Phil's earlier software.

I tried to mail this direct but it bounced. (Sorry)

In rec.radio.amateur.packet you write:

>Hello,

Hi,

>I'm trying to connect a pc running MSYS 1.11 to a pc running
>KA9Q using SLIP.

Seems to be a common situation.

>I think I know quite a bit about MSYS and have it configured for a
>1200 baud link. I have tried running MSYS on both systems and it
>works great. I would like to run KA9Q at one end.

Ok... MSYS doesn't talk SLIP, you have to use KISS and AX25 over
the serial line. I have an MSYS box running on an XT with
2 radio ports and a serial link to a SCO Xenix machine running 890421.1

NET (KA9Q) which also has a serial link to my PC/AT running 910618 PA0GRI
NOS (KA9Q). All the links are setup as if they were normal 4800 baud
links to a KISS TNC. It's slower than SLIP but still works ok, especially
if you tell msys that it is a full duplex link. :-)

>I remember someone else was working on this problem b4 and it would
>be easier for me to ask then to figure it out.
>I remember something about using Datagram mode in KA9Q's Net program

MSYS doesn't support Virtual Connect mode IP. You have to use Datagram mode.

>If you have tried the previous and got it working tell me how!
>a copy of your autoexec.net would be helpful as the docs to KA9Q
>are not that easy to understand.

If you can't get it working, tell me and I'll mail you my AUTOEXEC.NET and
MSYS.OPT/MSYS.DO.

In my posting on how to use my packet<->internet gateway, I
apparently made an error.

My packet radio address is: "W2XO.#WPA.PA.USA.NOAM" .

I left out the ".PA.". Gotta quit typing at 3am 8-) .

Thanks to those who called this to my attention.

<...The TNC 2 clones do full-duplex,
believe it or not. Grab your dual-band HT, find a buddy, and try it out...>

No need. Just make up a loopback connector, plug into the "radio" port on the
TNC and talk to yourself!

(Seriously tho', it's useful to sort out where faults lie, and when you're
first setting up - the fewer boxes to deal with,m the better!)

At the urging of a dos/ham friend I just downloaded MAC-Net 2.2and it looks
like a very impressive package for the ham packet switchers.

I'm not a ham but running a MAC II FX with a 3Com Ethernet card and have
MacTCP available and installed. My question is, Is possible to use MAC-Net
as a front end for a TCP/IP node.

I have just started reading the doc's that came with it and a quick perusal
of the Autoexec.net file gives me some hope that it might just be possible.

If there is anyone out there who has attempted such a feat I would greatly
appreciate any assistance in getting the package up and running.

Thanks,

Norm Steffen

For the sake of anyone out there using a Kenwood TM721 on packet who would like to use it to run ports on 2M and 70 cm simultaneously I can report that I have found a way to do this.

Because both bands, including frequencies and rx/tx state, are controlled by a serial bit stream from the cpu I had to find a way to automatically push front panel buttons and "trick" it. Additionally some transmitter circuits are normally shared between the bands. Kenwood appears to have stopped just short of making it a truly dual band radio.

It also had to be able to hold off transmitting when the alternate band transmitter was busy. This requires either using the SQUELCH line (on my PK88's at least) or ORing the tx-busy signal with dcd and redefining dcd to be a more generic "physical layer busy" signal.

I don't know that there will be many desiring to use their TM721s this way but if someone is interested I can give details. It takes a few additional IC's and some circuitry to push a front panel button but seems to fit inside the box in the area above the 70 cm PA shield. It probably isn't for the fainthearted but shouldn't take more than a couple of evenings to complete.

I use a DEC VT101 dumb terminal for packet as well as phoning into the campus computer system. I pretty much have figured out how to set up the thing for each case, but I need some particulars. Specifically, I need to know what exactly each of the digits in the four groups along the bottom of the second set-up screen affect. I know they are just other set-up parms, but I dont know what they are. This important in as much as I want to try some new things with the terminal, and it would be pretty much imperative to know these parms.

Therefore, if anyone has any info, has had experience with the vt101, or just knows something, email me at the below address, or reply on the newsgroup.

I'm having trouble getting the local MSYS system to forward mail to another BBS.

I sent a message using

     sp kb8ete @w7bkh.wy

but the l command shows no @BBS field, and the message never gets forwarded.

The destination call is a user of the local bbs, who is currently travelling. Does MSYS override the @BBS I specify if the destination call has a home bbs set? How can I get MSYS to accept the @BBS?

I am looking for some help for a friend who is trying to get his WA7MBL BBS to forward mail to a system running NOS. We've figured out how to handle the connection/forwarding from NOS to WA7MBL already, we just need the reverse process.

The biggest problem is getting WA7MBL to send a blank line upon connecting with NOS so that NOS's prompt is transmitted back to the WA7MBL system. What do we need to do get WA7MBL to understand NOS's responses?

Tony

That actually has nothing to do with TCP, per se, but the TELNET protocol.
TELNETs that don't support LINEMODE, or that always insist on handling
  line-editing/echoing themselves will suffer when the underlying transport
  has high-latency. Certain tweaks (like the nagle algorithm) can help you
  here, but only for fast typists. No protocol I'm aware of can deal with
  single-character-at-a-time without introducing delay. You either want
  efficient link utilization or low delay--you can't have both.
  There are protocols (LAT, for example) that "multiplex" several telnet-like
  connections into one virtual circuit. But they also degenerate when
  there's only 1 "terminal" active within its timeout "window"--which is
  remarkably often.

I am setting up a remote location for packet switching to enhance the local DX Packetcluster. I wanted to use the G8BPQ package. I have the 3.59 version running, although I still can not connecet with myself (present belief is that a bad connection exists between the DRSI board and the radio). To control the system, I intended to run PC Anywhere from my home for various maintenance functions. The system running the G8BPQ is a Novell Network as well.

Here are the questions:

1. Will G8BPQ exit to a DOS shell while I run PC anywhere to prepare for the connection? If not, what software package will perform this task adequately to allow the system to digipeat all those who need it.

2. Will the DRSI board operate with the Ethernet board installed? My preliminary experimentation indicates there is a problem.

3. Lastly, is there a updated version of G8BPQ or other software that might accomplish all my requirements.

Respond directly to me via e-mail. Any reference to someone with experience with G8BPQ will be helpful also. 73, Dave.

Anyone using PMP that is in 73 Magazine? Looks great! Got my check in the mail this morning.

What is PMP?

Uses your PC for a TNC, needs a little hardware (one chip). Connects to Parrallel port, and serial port for power. Uses software on disk (not ROM). Sounds like what a bunch of folks have been asking about.

Get the magazine (August 1991).

Hmmm, It sure looks interesting. I'm gonna build it. 73 mag mentions it's
available via Internet, I assume that means this internet... Anyone have
a site reference for it? I'll check Archie, but please let me know if you
know where it is. I doubt Archie will have it listed yet. If you don't know

where to find it, but you have it, or can get it from the 73 BBS, or wherever
please put it somewheres on the landline Internet.

Actually, your scheme won't work as proposed because the "real"
Internet doesn't have network 44 in its routing tables.

But never fear; there's a new feature (a couple of months old) called
"ip encapsulation". It can do just what you want.

As the name implies, IP encapsulation places IP datagrams inside other
IP datagrams. For example, I can take an IP datagram between two
network 44 hosts and place that inside an IP datagram with addresses
corresponding to two routers on the "real" internet. This builds a
virtual link in the AMPRNET that consists of a specific path in the
real internet.

Incoming packets addressed to the local host that contain encapsulated
IP datagrams are automatically extracted and rerouted. Outgoing
packets are directed to a "pseudo interface" called "encap". You
specify the de-encapsulation router in the gateway field.

E.g.,

route add [44.64]/16 encap 128.96.160.2

says to take any packets destined for addresses in Northern New Jersey
(44.64) and encapsulate them inside IP datagrams addressed to 128.96.160.2
(my router at home, which sits on both a packet radio channel and the
"real" internet). Of course, for this to work, my router has to have
a reply path, e.g.,

route add [44.62]/16 encap 192.100.76.2

which encapsulates packets addressed to the Central Virginia segment
of AMPRNET in IP datagrams to emperor.handheld.com (WA4ONG's machine).

This scheme has been working quite well. As more sites appear that have
both radio and Internet connectivity, the Internet could well become
the ultimate packet radio "wormhole".

Since (for now) the routing info would have to be static, any thought to
publicizing a list? I'd be glad to maintain one on an anonymous ftp site.

I recently wrote some code that makes it possible to encapsulate AX.25
frames in IP (according to RFC-1226) and tunnel them across the Internet
to some other site where they may be sent out on the radio channel again.

In a way, this is actually a superset of the 'encap' feature since by
encapsulating IP datagrams in AX.25 frames, and then encapsulate those
frames in IP one would be able to tunnel IP datagrams between RFC-1226
conformant hosts.

I have included my original message describing this feature below.

Anders W3/SM0RGV

---------- Forwarded message begins here ----------
Date: Mon, 24 Jun 91 05:42:40 -0400 (EDT)
From: Anders.Klemets@cs.cmu.edu
To: tcp-group@ucsd.edu
Subject: AX.25 on top of IP

I have implemented Brians RFC-1226 for transmitting AX.25 frames over
IP in NOS. Apparently nobody else has done it for NOS yet? The code is
pretty simple since parts of it was already there. For instance, the
code for calculating the HDLC checksum was already in the file ppp.c.
(Although I am not perfectly sure that I am generating the right FCS.)

To make the AX.25/IP code more useful I also added a tiny piece of code
that implements crossband digipeating.

Here is how to use it.
Suppose that I am running NOS with the callsign SK0WE-2 on the radio
interface. I want to setup a wormhole with w1xxx.foo.com. I will then
have to type:

     attach axip ai0 256 w1xxx.foo.com sk0we-3

where "ai0" is the name of my new 'wormhole' interface.
"256" is the MTU for AX.25.
"w1xxx.foo.com" is the hostname of my peer.
"sk0we-3" is an optional callsign of this new interface. The crossband digipeating to my radio interface would not work if I did not specify a callsign (other than sk0we-2.)

That is all. Assuming that w1xxx has done a corresponding setup, I can now type

```
connect ai0 w1zyx w1xxx-2
```

and the AX.25 frames will be sent to w1xxx.foo.com, where he will digipeat them on the w1xxx-2 interface, which hopefully is the 2m port.

As long as both I and w1xxx use different callsigns on the radio and wormhole ports crossband digipeating is supported.
One of the local TNC users will then be able to type

```
Connect w1zyx Via sk0we-3, w1xxx-2
```

There is also a sequrity feature: The code will ignore AX.25 frames received from IP hosts that have not previously been enabled with the "attach axip" command.

The changed source files are available at ucsd.edu as hamradio/ka9q/incoming/axip.arc.

In aticle <2462@ccadfa.adfa.oz.au>, by me (Warren Toomey):
> The problem is, of course, to route the 44.any.thing.else packets
> correctly over the Internet.

Which is more of a problem than I thought. I assumed nos, when given

```
route add network interface gateway
```

would use source routing. After playing with it yesterday, it doesn't.

However, Jim KB3KJ mailed me a solution. The latest nos has an encapsulation function that encapsulates one IP packet in another. Doing

```
route add 44.x.y.0/24 encap real.inter.net.host
```

will wrap all IP packets in another IP packet, with destination real.inter.net.host. This host must be another nos box, for it to unwrap the `real' IP packet.

Your gateway/44-address details by email please, I can't wait to try this!

Cheers,
Warren vk1xwt

Hello out there, there are some more problems with the GRI NOS,
When someone is connected to the MBOX, and uses the "G" command, he will
never receive anything untill he breaks with a "^X" !
The same goes for the Net/Rom connect command ?

Let's hope, that Gerard creates a new version, because the GRI NOS version
can do more and is nicer to work with then the G1EMM version 1.6, witch I am
using now.

Bye Bye and greetings from Holland

Greetings -
I run a fairly successful wormhole from Southern California to
the Chicago area. It's carried on a 9600 baud async statistical
mux channel used by my company, MICOM. The data communications
link is provided by the computer room manager (me!).
The western end is linked to the 6m, 4800 baud trunk that runs
from Ventura County east to the Arizona/New Mexico border.
The eastern end emerges on a 1.2 GHZ/9600 baud trunk that
in turn links to the CAPRA Packeten packet switch.
I run data comm links to other cities, and am interested in
setting up wormholes to one or more of those sites.
Those possible sites are:
Newton, Mass
Marietta, Georgia
St. Louis Missouri
Hackensack, New Jersey
Santa Clara, California

Equipment requirements are : some TNC/modem combination capable
of running at a moderately high data rate on the RF link. The
radio should run at AT LEAST 2meters or higher frequency. This is
because the antenna will probably need to be an indoor or window
antenna, and is necessarily limited in size.

The node on that end would be linked to a G8BPQ packet switch in
Southern California, which would allow communications between all
the linked nodes ("wormnodes"? "nodeholes"?).

If you or your group think you can provide equipment that meets
the requirements, please let me know, and I can provide a contact
name in the office closest to your area. You can then arrange
for a site survey to determine if our office is suitable as an
RF site. (That's the caveat: I have never visited the

offices, and don't know how inconvenient they are for antennae.)

I've been trying to get interest in this project for several years,
and CAPRA is the only group that's come through so far.

Looking forward to hearing from someone!

73, Orv WB6WEY @ W8AKF   44.6.0.128

For those of you using my packet<->internet/uucp gateway, a few
little things...(grouch, complain, whimper, whine 8-)).

1. Please include the packet bbs style "Hierarchial address" when
mailing. My data base is limited and since accessing a nework
database at 1200 baud is no treat, this isn't practical. If you
are not familiar with the "H addressing" concept, it is just
plain old source routing (source specs the route). A typical
first line of the message would look like:

SP K7XXX@K7YYY.AZ.USA.NA<K2ZZZ

Where:
     k7XXX is the destination station or address
     K7YYY is the destination bbs
     ".AZ.USA.NA" means "Arizona, USA, North America".
     K2ZZZ is the originating station.

However 8-) ... the way my stuff parses, you can't mail to
just ".AZ" . If you are going to shorten the address and
assume "USA and North America", that's fine, but I parse
for ".AZ." for reasons of possible conflicts with other names,
so you have to put on the trailing "dot".

3. If you would like your mail delivered *from* packet radio to
your internet account, then please e-mail me with your
internet address. The only way I have to do this is to build

a table of "MX Records", so to speak, and I need your address
to do this.

I will post my list of ham call->internet addresses on here when
I get a few more of them for others that might want the list.

4. My apologies for the non-lightning speed of the service.
I have to scan all the mail going out since the big
brew-ha-ha about the FCC holding packet bbses liable for mail
content, so sometimes I get tied up in other things....and
so it goes. I usually do this twice a day, so it's not internet
speed, but it's usable..

I am leaving for the east coast in 2 days, and know I should have posted
this question sooner, but... here goes:

In San Jose here, I am registered at N6LDL as my home BBS.

I travel with a HandiPacket configured as AA6IY-10.
This weekend I will be away and would like to exchange mail with friends
back here, so I am planning to 'find' a BBS I can hit in New York and
route mail back to N6LDL.CA.

Question: What addresss can I forward to my friends to route mail back to me?

If they use AA6IY@whatever.NY, will they get to me?
Will I need to register at that guest BBS telling it my home BBS is that
   guest's BBS? Do I need to un-register at N6LDL (though I don't
   know how to do that)?
If I tell the guest BBS that my home BBS is N6LDL.CA will mail be turned
around back to CA before I get it?

Any help would be appreciated.
Tnx,
Gene

We are putting together a new network on 1.2 GHz and one of the things we
want to do is to run high speed packet.

We have just completed a group buy of Yeasu FT-912R (1.2 GHz) and we would like to
put them on high speed packet. So I have the following questions:

- What modems are available for 9600 baud packet?

- What is good bad about each of these modems?

- What do we have to do to the radio to make it work at 9600 baud
  (specific instructions would be great! :-)

Thanks in advance for your help!

What's the easiest way to tell if there is enough packet traffic
in my area to warrant getting involved in it? I live about
45 miles from Kansas City, which should have atleast some packet
users. Am I close enough to be able to link with them? What
would kind of power would I need from a 2 meter radio to get to
them?

Thanks for any help,
Chris

I would like to use the serial ports on the back of a
sparcStation to connect to some equipment that expects
a proprietary protocol on top of SDLC.

In an ideal world, I would open a file descriptor on /dev/sdlc
and read or write sdlc 'frames'.

SunOS does not provide such a low-level facility (even under
sunLink X.25) so I am looking for kernel code which either
implements the above or gives me enough information to attempt
my own driver.

Any help would be appreciated,

....Maarten

K9NG was one of the original 9600 baud modems, but the G3RUH is an
improvement on it. You can get K9NG kits from TAPR for $35, or G3RUH
modems built from PacComm (and others) for around $100.

>   - What do we have to do to the radio to make it work at 9600 baud

Well, high speed modems tend to require crystal-based (varactor modulated)
rigs, because the frequecny response has to go down to almost DC, and most
synthesized rigs won't do that. Why did you buy the radios before you knew
how you were going to use them?

I saw a post from someone else who needed a temporary address away
from home, but haven't seen any further discussion on it. Is there
a way?

Also I have been having trouble getting mail between Atlanta and
New Orleans. A few messages have made it, but have very different
routings (and delivery times). Is there a way to force or suggest
a particular routing?

Thanks.

Howdy. I have a TAPR TNC-1 (beta version) that I got at a hamfest three or four years ago. I would like to hook it up to the Yaesu FT-470 HT that I have borrowed from my school's radio club.

Here's the problem. I have misplaced my TNC book. The school has one. Will the pinouts for the radio hookup be the same for the TNC-1 (as given in the school's manuals) and for my beta version? Is there something special I have to do to get these two things working together? I'm of the opinion that the FT-470 has only a 2-wire mic jack including the PTT, whereas the TNC-1 has two wires for PTT and two for the mic.

Another thing. I assume the PROMs in this thing are, shall we say, a bit outdated. Where can I go to get newer firmware for my TNC?

Please e-mail responses to me. I've had my license for 5 or 6 years, and I'm just getting started in all this stuff, and I'd like to get going with packet ASAP. I'm going to try to ftp some of the packet stuff from ftp.cs.buffalo.edu... is there anywhere else I can look?

Thanks in advance, and sorry for asking so many questions. :-)

If someone knows where to find the famous sccprint.arc send the
mail to the digest to know it all.
I we found it a can send it to any one with e-mail.
I will get it with bitftp and I can forward it to anyone.
We have here a lot of 8530 on a ACE card (4 of them) with a 80186
cpu and 2*62256 ram chips . If anyone has packet-tcpip(ftp...)
software for this card pls help me.

Subject: Proposal for Packet BBS data transmission changes
Message-ID: <070291.111917.enge@ibm.com>
Date: 2 Jul 91 18:27:45 GMT
Sender: daemon@ucsd.Edu
Organization: UCSD Usenet Gateway
Lines: 82

One of the problem in doing Packet BBS to BBS compression is that the
current implementations are not standards. In looking over both the
FBBS and G1NNA compression schemes, I didn't like a lot of what I saw.
Unfortunately, by the time I got a copy, both schemes were up and
running.

In an attempt to converge to a single solution we can all work with
and to prepare for new capabilites not already addressed by current
BBS protocols, I offer my own proposal. Comments are welcome.

This is a proposal for better BBS to BBS transmissions. Capability
will be indicated by SID letter "D". The purposes of this proposal

are:

- BBS-to-BBS authentication
- Transparent transmission of data between BBS
- Compression using standard routines.

1) The following control codes are defined:

```
01 -- AUTS -- Authenticator set
02 -- SBUN -- Start block uncompressed
03 -- SBHC -- Start block compressed with LZH -- clear tables
04 -- SBHN -- Start block compressed with LZH -- no clear tables
10 -- DLE  -- Data link escape
11 -- AUTR -- Authenticator response
12 -- ETBC -- End block.  Two bytes follow with CRC-16
13 -- ETBA -- End block.  Two bytes follow with encrypted CRC-16
              as a block authenticator.
1D -- EOF  -- End a message or file (CTL-Z)
1E -- FLU  -- Flush message
1F -- NAK  -- Resend block
```

2) Data stream will have two states: non-transparent (outside a block) and transparent (inside a block).

3) Blocks will be started by the SBxx codes and ended by DLE ETxx. Inside a block, the need to transmit a DLE in the data will cause the sequence DLE DLE. Any control codes transmitted inside the data block will not be interpreted. DLE followed by a byte greater than 31 (Hex 01F) will be tolerated and left in the data. DLE followed by a byte of 31 (Hex 01F) or less and not an ETxx character is an error.

4) Authenticator exchange:

AUTS will be followed by three 16 bit unsigned numbers.
The three numbers will be encrypted using DES.
Example:

(AUTS) n1 n2 n3

Response will be AUTR followed by a 16 bit numbers.
The numbers will be encrypted using DES.

(AUTR) n4

n4 = (n1 * n2) modulo 65536

5) Block Authenticator

The block authenticator will be the block CRC XOR with n3 and then DES encrypted.

Typical BBS exchange. Things in () are either control characters
or a 16 bit unsigned number (e.g. (-n1-))

        (connection occurs)
BBS1 = [4RE-2.12-DMR$] (CR) > (CR)
BBS2 = [4RE-2.12-DMR$] (AUTS) (-n1-) (-n2-) (-n3-) (CR)
BBS1 = (AUTR) (-n4-) (AUTS) (-n1-) (-n2-) (-n3-) > (CR)
BBS2 = (AUTR) (-n4-)
       SB (SPACE) TEST (SPACE) @ (SPACE) USA (SPACE) $1234_AA4RE (CR)
BBS1 = OK (CR)
BBS2 = (SBHN) compressed message goes here (DLE) (ETBA) (-x1-) (EOF) (CR)
BBS1 = > (CR)

Note: EOF (Control-Z) must be outside the block. This allows the
distant station to validate the authenticator/CRC and drop the
connection, NAK, or FLU as desired.

Anyone know what the format of the RAW AX25 frame is? This frame is
delivered by the BPQHOST mode function 11 and consists of 5 bytes of
header and the AX.25 frame itself. I know the AX25 stuff but the
header info is needed. The first byte seems to be hex DF and the last
two bytes are the length. Somewhere in the middle two bytes is the
port number. Could it be multi-dropped KISS format?

You need a Technician class license. (no code is ok). You have listed
the proper pieces of hardware and software required. A simple terminal
emulator program for your computer is sufficient for starters. If you
have an Amiga, C64, MAC or PC you have enough computer hardware.
In metropolitan areas, you should be able to hit at least one BBS with
an HT and a whip antenna. Just place the HT some distance (10 feet) away
from the computer and TNC to reduce RFI from the digital boxes.
Dual bander HT's are the current "hot item", but 2 meters is sufficient.

Three manufacturer's make the majority of the market: AEA, Kantronics,
and MFJ. Drop them each a note requesting info. I did that myself a
few months ago. My choice was the KAM, but with an extra class I can
use the HF frequencies as well. You should start simplier and upgrade
as you go.

One last thing. Most packet BBS's are linked together. If you can hit
one, you can read all of the bulletins and even send messages across the
country and beyond.

Just look at this an adventure which is supposed to be a fun experience
while you learn.

   I seem to have a couple of problems, possibly related. When
I telnet into NOS (MS-DOS) and try to telnet from there to another
machine (ie "t host.domain") nos tells me:
           Unknown host host.domain
I have put hosts.net in nearly every single conceivable location
thinking NOS couldn't find it with no luck. Is there some trick
here?

    Also if I tell NOS specificly the address (ie. "t 192.25.217.1")
I get a:
           Permission denied.

    Thanks for any help here.

          Tim

I would like to ask the opinion of you all on the idea of condensing
the header information on Packet BBS mail. Recently I started writting
a fairly simple program to parse the incomming headers on BBS traffic,
grab the date, time, callsign, Hierarchial Address and Message number
information and then regenerate the header with just that relevent information.

For example say a header arrived like,

R:910203/1223z @:AB1CDE.#ZA.AUS.OC AusNet><Mars Gateway BBS #:1234 Z:0341

my program would then reduce that to,

R:910203/1223z 1234@AB1CDE.#ZA.AUS.OC
or
R:910203/1223z @:AB1CDE.#ZA.AUS.OC #:1234

depending on what you prefer.

What I would like to hear is what do people think of such a "Daemon" running on Key BBS's like relevent Overseas Gateways etc to help reduce the size of traffic to be passed, (especially over some of the rather poor HF circiuts that are used).

I would like to implement the program on a couple of BBS's in Australia (they have shown interest in the idea) but would like to hear what overseas SysOps think of such a Daemon running that would in many cases half the length of the headers.

Constructive comments most welcome. Flames > /dev/null.

I have no objection to the program. As long as the header meets
minimum requirements, it will not affect my BBS program. I would
recommend you leave the originating BBS header alone though.

It is unfortunate that you have to write it though. The current
version of AA4RE BBS has two headers, one for messages originated at
that BBS and one for messaged that are just relayed. The relay header
was supposed to be short (like you proposed). Not everybody is
following this convention and none of the other authors have picked up
on this as far as I know.

Examining headers also shows many with the Z:xxxxxx for zip code.
Since we all route via hierarchical address these days and not
by zip code why waste the bytes?

  PACKET INFORMATION NEEDED.

  Does anyone have the details on AX.25 protocol in a file? If so,
could you please send it to 'edw@wells.UUCP'.

  I am in the process of writing some software for the PK-232 (actually,
any TNC) in HOST MODE (RawHDLC ON possibly).

> or
> R:910203/1223z @:AB1CDE.#ZA.AUS.OC #:1234
>
> depending on what you prefer.
>
Sounds OK to me. You will have to make sure you can cope with all the
different header formats, though. At the moment, I know of the following :

R:910203/1223z 1234@AB1CDE.etc
R:910203/1223z 1234@:AB1CDE.etc
R:910203/1223z @AB1CDE.etc #:1234
R:910203/1223z @:AB1CDE.etc #:1234
R:910203/1223z @AB1CDE.etc

Why people want to keep changing the format I'll never know. It would be
nice if everyone could standardize on one format, but then again it would be
nice to see a flying pig as well!

sccprin5.arc is on col.hp.com (15.255.240.16) and is part of the
file packet/pe1chl/pc2.lzh. However there is no etching pattern included
only circuit schematics and a component placementdrawing. Boards are to
got from PA0HZP (henk@nikhef.nl). Hope that will help you.

The Northern California Packet Assn (NCPA) has published a book
containing all of the series of articles by WB9LOZ that was circulated
on the BBS system. Larry (LOZ) rewrote and updated sections for the
book. While pointed towards northern Calif amateurs, the book contains
all the info needed to get started in packet radio.

Hello friends !

I still do not beleive what happened here, it is so awfull.
Anyhow, it is maybe of interest to see how HAMs responded to
emergency.

When unexpected attack of YU Army to Slovenija happened, the first HAMs
reaction was: be QRV, stay tuned. There was no need to help with
proffesional communications, all worked OK. We only blocked
military repeaters and simplex channells on 2m band;
forunately most of MODS to
expand RX/TX range of japanese RIGs were available on BBSes.

Later on we were requested not to make QRM on military QRGs, because
we blocked channells so effectively, that YU3 intelligence could

not get any information from military communications. there is not yet
enough 6m equipment here, to effectively block military there, but
we were of some help to YU3 police. (YU got 50 MHz band few weeks ago).

Most of HAM communications(beside those helping actively defense operations)
are on helping press (some telephone lines are broken) and red cross. A lot
of personal request were handled by HAMs also (like: My parents are there and
 there, we can not get them by telephone, are they OK ?).

YU3 HAMs can be found on 2m and 70cm FM, also there is a net on 3.605 SSB.

Packet:
As my role was in packet, I can tell the story from first hand.
First action was to check network. Everthing worked, so I send few bulletins
with emergency instructions to BBSes. Packet stations on R TV stations was
activated, with printer connected to C-64. I got few tlf numbers, like
red-cross, direct line to news service etc. Quickly, first news reports
were comming from area telephone cut. Also, i helped forward a QTC to
DL radio, when international telephone lines were overloaded.

When army started bombing of TV and communication centers, where most of
packet nodes were, we prepared secondary links. Few HAMs left packet stations
QRV, to be used as digipeaters. Several nodes were attacked:
4N3B on mt Boc, 4N3P on mt Pohorje, several times 4N3H on mt Kum,
and 4N3L on mt Krvavec. 4n3H antennas were destroyed, thus 23cm backbone
network was cut into two pieces. But, 2m links were ready - and YU3 packet
network is fully operative. No harm was done to 2m and 70cm FM
repeaters, so 4n3H is the only HAM installation destroyed.

We get also some help from outside YU3 - First of all, I asked everybody
to stop BBS forward and other DXing over YU3 - network is now free for
emergency traffic. Also, neighbour HAMs are ready to help us with
secondary links on 2m, if our current nodes are destroyed. We have a
backup ready for any node. Also, they are in touch with red cross and others,
if there is any need.

So far, HAMs were again playing our role in defence of our country.
I hope is needed no more, but we are ready.

Packet node 4N3H is probably first HAM packet node to be destroyed
in military attack. It had 4 antennas on 23cm to 38400 bd YT3MV 23cm
station (4N3H-12), 2m port on 144.600 (4n3h), converse node 4N3H-3 and
we were fixing also 70cm wide bandwith 19200 bd manchester user access node
on 70cm.

So much about HAMs in war, I hope we would be able to make full report
when war is over.

   Best 73, peace to everybody, iztok YU3FK

X-Reader: NETNEWS/PC Version 2.1

HERE'S how you find software on the internet - in this case SCCPRIN5.ARC
and the PE1CHL driver for the SCC.

However in the spirit of "Teach a man to fish, don't just give him one"
here's how you can find out :-)

Here's a list I got from archie the internet software lookup service at
ARCHIE@QUICHE.CS.MCGILL.CA (to find out more info send a mail message
containing the word HELP on a line by itself.

SCCPRIN5.ARC contains the schematic for a PC card with two 8530 SCCs.
It can be used with NOS to give AX25 and IP capability.

PE1CHL wrote a generic device driver for the SCC - that's why I searched
for this.

==========
Below is the result of sending the lines:

prog sccprin
prog pe1chl
quit

in an email message to archie@quiche.cs.mcgill.ca

ARCHIE is a GREAT SERVICE - my thanks to those who run it.

Cheers
Giovanni - ZL2BOI

As I remember, when I logged into THUMPER... (see below) it referred me to
the site 128.54.16.1 where all the KA9Q stuff had been moved to. I did get
it so it can't be too hard to find :-)

I added the odd dashed line below :-)

Anything that takes out the self-serving advertising material is all for
the better.  The headers should contain no more than the essential info,
with possibly a brief QTH to assist in forwarding by hand.

Are anybody in possession of the German manual for
the Baycom packet radio programme for the PC?
I have downloaded Baycom v. 1.2 from wuarchive.wustl.edu,
but I find the English translation of the original
manual to be almost a complete loss. It is extremely
difficult to understand all the details. It appears to
have been translated by somebody that neither speaks
English nor German.
If anybody have got the latest version (1.4) I should
like very much to receive of a copy.

Hello out there!  Is there a program that can talk to two TNCs or to two
COM ports at the same time?  I have a 80286 PC that I would like to monitor
two different TNCs at the same time (split screen would be great with
one COM port on top and the other on the bottom).  I know I can get DESQVIEW
to do this (right?), but it seems to me that a single program should be
able to do it.  I guess I could write my own :-(

Thanks in advance!
Phil

I have been using Enable for the last couple of years to do something like
what was requested in a 7 July post. I keep the internal modem (on a
Zenith Supersport 286) connected to one port, while at the same time I can
be connected to a packet tnc via another port. Enable allows this through
opening a window. All one has to do to go from on to another window is ALT
up arrow, then SHIFT F9...

I find it very useful and feel that 2 tnc's would be supported..

Suppose I am launching a TCP/IP based packet balloon flight, and plan to
chase it mobile. While mobile I want to check into the BBS I operate at

my home as well as check telemetry on my voice repeater via packet, and
of course contact the balloon, which is crossing through a couple states.

This is, of course, theoretical at the moment but could become reality
for someone VERY SOON. It seems that at least 4 distinct IP address would
be needed for this (to distinguish the different ways actual packet routing
will happen). Would any additional ones be needed for the mobiles just
because of moving? How do you reconfiguring it for a high flying (>30km)
balloon? What about 2 balloons?

>

[Roy's proposal deleted]

The proposal looks great. The only thing I wanted to mention was that
(I think) compression of individual messages is a waste. Compression on
small files isn't that effective. All it would do is beat the hell out
of the machines doing the transfer. If compression is used, a batching
scheme should be used. Wait for X amount of bytes to accumulate, then
batch up the whole thing, compress it, and forward it.

It's going to happen, so I better get used to it, but I want to state in
public that I think authentication sucks. One thing that still thrills me
to this day is that you can log into any packet bbs and do anything you

want without being 'authorized'. I TOTALLY HATE phone bbs's that impose
restrictions until someone calls you. Authentication during forwarding of
messages won't have an impact on me (not too much), but PLEASE don't start
making normal access to bbs's 'secure'. I think that steps to do this may
be taken in the near future, and it will totally wreck my day if it happens.

Phil,

Have you considered trying Phil Karn, KA9Q's, NOS TCP/IP code? It may be
more than you want or even need, but it will certainly handle multiple
TNC's, and/or other communication devices...

Todays thoughts:

It seems that the .ampr.org domain needs a GEO satellite with a port
in each metropolitan area. I'm not sure exactly how some of the
internet routing works but it seems that this would allow the common
connection needed to establish one group. Naturally the link would have
to be fast and well co-ordinated, but that seems within ham capability.
Any chance of a GEO AMSAT? Could it be developed on a commercial bird?

Some local packet<>internet connections would be possible if the
content rules were changed. Has there been any petition to request
relaxing of the content rules for short-range high-speed packet where
the occasional content problem would have no real impact? Seems there
should be a case to be made here.

I am looking for pointers to an elementary description of how
CDMA works in practice; I have seen simple example descriptions,
I have no idea, for example how many chips/bit occur in practice,
whate actual bandwidth is in the real world.

>too cheap to build in a timer.

Most people don't need the timer so Kantronics justifibly doesn't build it
in.

> One thing that will definitely kill a Gel Cell is overcharging, since
> you can't add water. If you boil it off, you ruin the cell.

That may be true, but the ease of charging of gell cells makes it somewhat
irrelevant. Gell cells can be charged to 100% of their capacity by connecting
to them a constant 13.8 volts, and can be left floated at that voltage
indefinitely without damage.

So, as long as you don't exceed 13.8 volts, you will do no damage.

I charge small gell cells using an LM317 voltage regulator chip set to 13.8 V.
They can also be floated across an existing power supply to provide automatic
backup capability. A diode should be placed in series with the supply output
to prevent the gell cell from shoving current back into the supply if the AC
power fails. A Schottky diode is best due to its lower forward voltage drop;
they are available from Digi-Key.

Serious users of UPS systems for computers replace their batteries on a
very conservative schedule, to insure extremely high reliability.
Since the UPS batteries are kept on a continual float charge they are usually
in great shape. I recently picked up two Yasua 38 amp-hour immobilized
electrolyte batteries for $25 at a hamfest. I always carry a voltmeter to
hamfests to check the conditions of any batteries before I buy.

Have you considered changing NOS to a REAL Network OS?
It would be nice to be able to dynamically load each network service
as required. I can imagine NOS being a full network OS where each
network service can be programmed as individual programs and NOS would

provide low level system services. This would allow the "value added"
features to be added without changing the NOS kernel, and be
distributed as separate programs.

Even though there is not a hardware timer in the Kantronics KPC2, I
believe their 6809 clone CPU has a on-chip watchdog timer so if goes
crazy, it will reset itself.

In practice, I have never seen a Kantronics product hang a transmitter
or go into an odd mode. Currently, we are running about 20 Kantronics
boxes around the Manhattan area, and we have never had any trouble with
them.

For my money, Kantronics have good functionality and extra features
that are nice to have.

The local electro-junk store has lots of normally-closed thermal
switches that can handle lots of amps - typically for around $1 or less
each. Yours may too. It takes only a moment to epoxy one to the
heatsink on your radio and wire it in series with the power lead. That
way, if your TNC sticks on or the cat sits on the microphone, the radio
won't burn up.

You can also add a simple 555 timer into the TNC, but that would require
you to be able to solder on a circuit board without cooking it, a task
that but few of today's amateurs are capable of.

A friend of mine (without usenet access) has asked me to post this
for him. He has a Paccom PSK1 and Heath HK232 connected in a tandem
arrangement for accessing the microsats. He is using a program
called PG which was written by some guys at the University of Surrey
in England. He has implemented the various TAPR modifications
necessary for connecting the two units together but he has not been
able to get the program to work with the system. The error message
that he gets is:

```
Sending a Break Signal to get TNC into command mode
TNC is not responding
Connect indication or RS232 DCD pin is stuck on
Abnormal Program Termination
```

Can someone suggest what might be causing the problem?

Also, someone mentioned that there was an article in '73 or QST in the
last 4 months about connecting the PSK1 and HK232 together. However, I
haven't been able to find it and I was wondering whether anyone knew
the correct reference.

Cheers,
-Graham (brand@wet.uucp or wet!brand@cca.ucsf.edu)

I just borrowed a pk232 to use on field day (got to get all the points
I can). I have hooked it up and connected to a few sites, had some

short QSO's etc, HOWEVER....

I'm unclear as to how contest packet QSO's are handle. Do I actually
'CONNECT' to each site that I want to work, or can I just
monitor traffic/call cq and 'monitor' responses.

Yes, I know I should probably just monitor on FD and do what every one else
does, but I'd like to be ready.

Any and all comments welcome....

Well, this brings to mind something I heard about nearly a year
ago. Some US and Canadian hams were developing a 9k6bps beast based
on a Yamaha 7901 FAX modem chip. I believe it used some sort of
stellar coding but it worked over radio. More to the point, it
required *NO* radio mods. I tried writing to the developers but
never heard anything.

Anyone else know about the status of this modem ?

Here's the original message.....

9600 BAUD (BPS) FAX TEST RESULTS

Conducted between WB8WKA (NOS TCP/IP) and WA8OOH (MSYS v1.08)

(Please reference my earlier posting "9600 baud FAX MODEM" for a more detailed description of the circuit.)

Between 7/25/90 and 8/6/90, the amateur radio stations of WB8WKA and WA8OOH tested a "V.29 FAX modem" chip, the YAMAHA 7109, between there respective packet radio stations. Distances involved where about 7-8 miles over urban terrain. Results where quite positive with respect to the performance of the radio link. Equipment and power levels used at each station follow:

RADIO EQUIPMENT:

WA8OOH	WB8WKA
Livonia MI	Farmington MI
ICOM28A (5 watts)	KENWOOD 7950+amp (160watts)
MFJ 1270 TNC	GLB TNC2A
MSYS V1.08 on IBM AT	NOS on IBM AT

Additional radios where also tested. At WA8OOH, good results where also obtained with a 215 Kenwood HT at 200-300 milliwatts. A Kenwood 7730 was also tested with very poor results. Past experience with this radio and the failure of any PL to function correctly on it may need further investigation.

At WB8WKA, tests where also run at power levels less then 160 watts with

excellent results, but due to the sharing of the radio with one of the Detroit/Windsor TCP/IP lan's, running lower power full time was not practical. In addition, a ICOM 2AT was tested at 100mw with excellent results.

Signal strengths at both stations where full scale, even at lower power levels. Antennas used at WB8WKA consisted of a AEA ISOPOLE at 50' while at WA8OOH we had a Hustler G7 at 20 feet. All tests where conducted on 2 meters.

THROUGHPUT:

As was to be expected, throughput took a dramatic step up. About one megabyte of files where moved via tcp/ip, with the throughput hovering around 100 bytes/sec. While this is certainly nowhere near "9600 baud", it was a significant jump over earlier tcp/ip testing at 1200 baud. It is thought that there may be some incompatibilities between msys tcp/ip and net/nos. Tests will be run latter this week between two msys stations to see if this figure can be improved upon.

In AX.25 operations, ("user" to bbs) operation was simply put, a dream. By using the "XF" command in msys, full packets where transferred. Setting "X22" allowed a full screen to be transferred at a time. Throughput was about 1 page a second, which worked out to be about 6000-8000 bits per second. From a "user" perspective (I was the user in this case) it made operating the bbs much more enjoyable. As many of our LAN's in the southeastern MI area our crowded, the additional speed did not go to waste.

If I may quote WA4DSY, "Oh where oh where is my HIGH SPEED DIGITAL"? What this means of course, is that we where not able to fully exercise the modems due to MSYS and/or our TNC's not being able to go beyond 9600 baud. The tnc's where modified for 19200 baud operations but we experienced dropped characters. In any type of KISS operation, it is important for maximum throughput, that your DATA link (async link) be at least twice as fast as your radio link. As we where not able to achieve this, then our hope is that much faster throughput can be obtained.

GENERAL IMPRESSIONS:

Audio setup is much more critical. Tones will tend to sound undermodulated. In addition to audio setup, a "keyup delay" circuit must be setup as well. This is due to the fact that these modems send a "training sequence" upon keyup. This must be held off until the radio is fully keyed up. (generally 100-200ms) Once these parameters are set up, things seem to be fairly stable and the modems can be relied upon in day to day operations.

IMPROVEMENTS:

A easier method for tuneup needs to be developed. If possible, mounting inside the TNC would also help. Current carrier detect in YAMAHA chip is useless. Have been unable to get state machine DCD to work on this chip but it is what is needed. Current layout use's +-5V, this needs to go. Must run on only +5V.

Also will add programming header and mode select DIP switch.

Existing PC (a carbon copy of the PRUG circuit board) needs to be improved. Quite a bit of digital noise exists on this chip and a re-layout of the PC board would help greatly.

THOUGHTS:

While my original idea of the use of this modem was "networking", more and more I am beginning to feel this will be the next step for the end user. In many applications such as the DX cluster, TCP/IP and bbs operation, increase of speed on the user LAN is becoming more important. While this modem should be a fine performer on our "network backbones", the ease of implementation and the fact that IT CAN BE USED ON EXISTING RADIOS UNMODIFIED should be quite appealing for the amateur that wishes to increase LAN throughput.

WHATS NEXT:

In the next week or two, I need to re-layout out the circuit board to include the improvements I have found. In addition, I DESPERATELY need schematics for TNC's. I have schematics so far for the TNC1, TNC2, PK232 and DRSI. If you have schematics for any *other* tnc, PLEASE send me a copy to the address below:

Jeff King WB8WKA
22816 Maple Ave
Farmington, MI 48336.

Also, if you would like copies of the article describing this chip, please send a SASE to me at the above address.

BETA TEST:

So far, about 16 people have expressed interest in participating in a beta test of this modem. What this basically means, is that we will all get together and make a group buy of parts and such to reduce our costs. In addition of course to the sharing of information that a beta test implies. With a professionally done PC board and all parts I expect costs to be on the order of 60-70 dollars. This is of course assuming we can get a decent discount of the YM7109 (fax chip) as it alone goes for $55!!

I am using version 113016 of G1EMM's implementation of TCPIP.
How do I make the program recognize nicknames in the domain.txt file?

My domain.txt has among other entries the following:
w9lzq-3.ampr.org   IN   A   [44.92.3.3]
kent   IN   CNAME   w9lzq-3.ampr.org

It is my understanding from the available documentation that the domain.txt
shoul relate the canonical name with the IP address. This does not seem to
happen. I keep getting "Resolving kent...unknown host...". What am I doing
wrong?

From where can I FTP the documentation for G1EMM's version 1.6 tcp implementat-
ion - if there is any available. I do have a number of different documents but
none relating directly to version 1.6

|>>on HF sideband using someone elses call.
|>True, but his voice will give him away.

You're saying that your voice is so well-known that every ham in the world is going to know it? Wow. For most of us, there'd be no way to tell if someone got on the air with a phoney call. The fact that it's a rare event is either a tribute to hams in general or is an indicator that in ordinary situations the vast majority of people prefer to Do The Right Thing.

My first instinct in this is that there's no reason why packet should have to solve problems that the other modes don't. If you can't verify identity in any other mode, then it seems pointless to get into baroque security schemes for packet.

The only ambivalence I have about it is that packet causes one problem that (most) other modes don't -- packet messages "linger." If someone scoops your call on sideband to do some Bad Thing then some people hear it but it's over as soon as the transmission is over. If someone forges a packet message, it can be cached in thousands of places around the world for an untold length of time.

The badness here has to be weighed against the goodness of being able to get into a packet system with no prior arrangements. It's all well and good to talk about security with encrypted passwords etc. but if you pull into a new town with a portable setup and want to work a little packet, you'd be SOL. Not to mention the chilling effect on people who want to try packet, but would be put off by having to "register."

There are schemes that would get around both problems to some extent, but I'm not sure it's worth the effort of implementing them at present.

The Kantronics KPC2 does not have a timer. I have heard several reports
of networks being jammed for long periods of time because someone left
a Kantronics unit on while unattended.

An automatic station without a timer is not just a bad idea; it's a violation of the FCC rules.

So, I have ordered an MFJ 1270 instead. It is $30 cheaper than the Kantronics, has a timer, and has an external modem interface that might be useful later.

Don't quote me on this, but I believe I once saw a version of NOS floating around that was supposed to be totally integrated into Desqview. This would make sense because Desqview has no problems allowing you to have multiple programs running with some sort of shared module.

Doing it on a PD basis, someone should marry it to Ctask, which would handle the necessary problems.

Another way is that with the new Turbo C, if you can actually get it to compile under it, use the -Y option to crank DOWN the memory requirement and let it do overlays.

This is quite true for vertical omni's, but not for directional gain antennas.
This works at the repeater site, but we'd been planning on yagi's at user
sites aimed at the repeater... and I haven't seen any great dual band
directional antennas? Am sure we could beat the dual feedline problem...

|> Have you considered changing NOS to a REAL Network OS?

Yes, indeed I have. And when you're done you end up with something
that looks an AWFUL lot like Berkeley UNIX. And since it already
exists, why reinvent it?

I understand that 4.4BSD UNIX for the 386 is already in beta test. The
only open issue is apparently whether the kernel will be totally free
of AT&T code. If it is, the entire system will be freely
distributable.

Much of my original advocacy of TCP/IP for amateur radio was due to
its existence as a de-facto industry standard. There's no reason why
we have to build everything ourselves just because we're hams. NOS was

a way of getting things started until regular off-the-shelf TCP/IP hosts were within reach of the average ham. This is just about to happen.

I would like NOS to continue doing what it does best: handling the radio-specific tasks in the network (IP-to-AX.25 encapsulation, radio channel access and routing, etc, as well as low-end MS-DOS clients). I've also found it a convenient vehicle for experiments with TCP and IP congestion control algorithms. But run the big TCP/IP applications on the UNIX systems where free and widely supported application code already exists (e.g., sendmail, BIND, etc).

Actually, you can make a simple but highly effective watchdog timer with even less effort than that. Just put an RC hipass filter consisting of an electrolytic capacitor and a resistor in the keying line, followed by a schmitt trigger (or gate of a mosfet used as a switch). A diode is also needed to discharge the cap quickly when the transmitter is unkeyed.

This is the circuit used in the original TNC-2 design. It is so simple (and the effects of a stuck transmitter so serious) that I think its omission on ANY TNC is simply inexcusable.

The Pac-Comm Tiny 2 TNC and the Pac-Comm G3RUH modem meet those price criteria.
I have a pair of the systems in operation here. Those were Dayton show
prices, retail is slightly higher. You will probably have to modify your
radio to make 9600 baud work. It's not strictly plug and play because of
the limitations of the voice circuitry in typical radios. Data compression
is not used on amateur radio for several reasons right now, mostly regulatory.

>Where does the future of full featured packet networking lie? Do you think
>a modified TCP/IP system will take over? I am interested in the following:

>2) Large file transfer capabilities
>3) Internet mail connection
>4) Internet access
>
>What system is my best bet? I really would prefer radio over telephone since
>I want to help advance Amateur Radio, need frequent network access, and a
>second telephone line is impractical.

Well *I* like TCP/IP for those applications. The non-commercial
limitations on amateur radio limit it's usefulness for Internet access,
but the functionality is there for file transfer and mail as well as a
good telnet implimentation. The KA9Q software, and it's various enchanced
spinoffs, are an attractive way to operate packet. I recently went to
the Gracilis internal plugin board in place of a TNC and use their
enhanced KA9Q code to drive a 56kb modem and their 9600 baud modem and
radio. I still use a TNC and voice grade radio at 1200 baud. I plan
to bring up an ethernet link to my Unix boxes in the near future so people
can log in to them via the radio.

Ultimately, I'm interested in distributed computing and hope to see a
network architecture that will allow me to play interactive real time
games with other stations and to try for the "ultimate supercomputer"

consisting of multiple machines working on the same problem in parallel
linked by the packet network. To do that, I need a fast transparant
network and I believe that the TCP/IP protocol working over 56kb or
faster links will eventually give it to me. Right now we don't have
a good dynamic routing system and the 56 kb network is still mostly
limited to interconnecting slow speed LANS where users continue to
run 1200 and occasionally 9600 baud. But progress is being made and
I can see a glimmer of light at the end of the tunnel.

I also have great hopes for Coherent as the multitasking OS to replace
DOS on our packet machines. Multitasking is necessary for my ultimate
goals and Desqview just isn't good enough. I don't even want to talk
about Windows.

I'm not sure PG will work with a TNC that doesn't support the TAPR
command names ... the docs mention that hardware handshaking is used,
hence pins 2,3,4,5,6,7 should be wired without jumpers, and that DCD
should indicate the connected state of the tnc. PG.TNC contains commands

to be sent to the tnc in addition to those hardwired into PG, and PGDONE.TNC
contains tnc command to be sent upon exiting PG; perhaps these files could
be modified for PK232 commands?

|>All this stuff runs on 12 volts so any car battery will do. A deep
|>cycle marine battery is better, but not necessary....
| ^^ ^^^^^^
|Probably not! Deep-cycle batteries get their two-part name
|for good reason:
| * Deep - 'cause their "acceptable" (according to the manufacturer)
| output voltage drops to about NINE volts or so.
| * Cycle - 'cause it can be discharged so deeply and then recharged
| more times than can a "regular" battery.
|
|But can YOUR 12-volt equipment run on 9 volts? Mine can't!

Most lead-acid batteries, including gelled types and
automotive batteries, do not take kindly to the voltage going less than
12 volts. It generally shortens the life of the battery severely.

The deep cycle battery probably won't have much current left when the
voltage drops below 12, BUT you can expect to recharge the battery and
not have to buy a new one.

By all means get your license and a two-meter HT. You might want to add
a solar panel to the bike to recharge the batteries. You will be able
to meet a lot of hams on your trip, and probably get lots of good
suggestions regarding places to visit or routes to avoid.
Just be prepared to wait ~7 weeks for the FCC to process the license.

Now, I am trying to get G1EMM's 113016 version of software to talk to
MSYS (packet bbs) using TCPIP. The connections seem very erratic and
the transmission speed varies greatly.

Has anyone ever tried to use Nos with MSYS. If so, can you please tell me
what the parameters in the setup file(s) for both pieces of software should
be. I think MSYS communicates using Datagrams and I have set my ip mode to
datagram. Communication with MSYS is virtually impossible using VC.

Can one also digi to another IP station via an AX25 digipeat?

What does one need to do in order to make the SMTP mail forward in MSYS to
work and talk to a station running the above mentioned version of NOS?

Any and all help would be appreciated...I am coming to the end of the rope!

     This will be difficult to find in the open press. A typical case
might be 500 chips/bit, and bandwidth between first nulls on the order of
10^8 Hz.

     You might want to check the latest issue of the IEEE Transactions
on Vehicular Technology, where Klein Gilhousen and other members of the
technical staff at Qualcomm, Inc. talk about their CDMA cellular system
(I haven't read my copy yet.)

There are some comments on:

> 9600 BAUD (BPS) FAX TEST RESULTS

>At WB8WKA, tests were also run at power levels less then 160 watts with
>excellent results, but due to the sharing of the radio with one of the
>Detroit/Windsor TCP/IP lan's, running lower power full time was not practical.

Now... using 160 W for few miles QRB ?? Just to block everybody around ?
Is THAT the way HAM network works ?? You were testing new modes, which
are not compatibile with old one, so if you stay on same QRG, this is
intentional QRM. Or it is too hard to make QSY ?

>MSYS and/or our TNC's not being able to go beyond 9600 baud. The tnc's where
>modified for 19200 baud operations but we experienced dropped characters. In
>any type of KISS operation, it is important for maximum throughput, that your
>DATA link (async link) be at least twice as fast as your radio link. As we
>where not able to achieve this, then our hope is that much faster throughput
>can be obtained.

Hints for everybody with same trouble:
1. Use N2WX or WA8DED EPROMs to unload RS-232 interface
   (They are quite usable up to 19200 bd on HDLC port).
2. Use normal level 2 digis few times, so any date send from PC
   is send several times over radio path.
  (C YU3FK via YU3FK YT3A YU3FK YT3A YU3FK YT3A)
  Then multiply number of bytes transferred with number of hops
  they took. If test is done on CLEAR QRG (160 W for 5 miles..)
  retries are not likely.
3. Put 9.8 MHz XTAL to TNC-2. With CMOS SIO-B and Z80 H it works !
  (NET/ROM, N2WX and WA8DED can operate 38400 bd on HDLC port)
4. If you HAVE to use KISS TNCs, then check again PC sw. Use FAST PC.
   HAMs run 56kb over KISS - so 9600 bd is not so fast.

>GENERAL IMPRESSIONS:

>In addition to audio setup, a "keyup delay" circuit must be setup as well.
>This is due to the fact that these modems send a "training sequence" upon
>keyup. This must be held off until the radio is fully keyed up. (generally
>100-200ms) Once these parameters are set up, things seem to be fairly
>stable and the modems can be relied upon in day to day operations.

TXDELAY: time to stabilize TX PLL + time to get maximum power +
 time to get signal over RX + sinhronization of RX modem. Only last
 point is dependent of modem, all the rest is fixed for given RIGs.
 If TXDELAY is 200 ms on 9600 bits/sec links then a lot of bandwith is wasted.
 Anyhow, I heard of even longer times from HAMs testing Rockwell chips.
 BTW: what is normal TXDELAY for G3RUH 9600 /HAPN 4800 etc modems ?

Radio links are NOT telephone links. Their characteristics are
definitely different. I never heard of echo canceler on HAM packet link;
also I wonder about behaviour of landline FAX modem chips on real VHF/UHF
links, with a lot of phase distorsion because of reflections.
I think noise characteristics are also different.
Smetimes I wonder how our modems work, when I look what is comming out
from RX output. I would love to hear on any comparations between
1200 bd FSK and 9600 bits/sec Yamaha chip on average radio links with
reflections etc.

I missed the original--is someone starting up with bicycle mobile?
It's great fun, by all means give it a try. My wife and I go 2-meter
bicycle mobile daily on our work commutes, and use cross-band full
duplex for long rides together. There is also a national bicycle
hamming group including some who do HF mobile. No CW that I know of :-).
There has been one documented bicycle-to-bicycle HF, from Wisconsin
to Florida.

Lots of fun. Listen for us on the 146.79 machine in Cleveland...

Last week I posted a query about "Gonetz," a store-and-forward
packet radio data network based on constellations of low earth
orbit satellites that the USSR plans to implement.

Jane's Defence Weekly had a brief passage about it in their 1
June 1991 issue. It is apparently based on an existing
military/security system called Sextet, which Jane's described
as "the only truly operational lightsat system in the world."
(Gonetz is a Russian word meaning "messenger.")

Thanks to the magic of Usenet, Ed O'Grady (OGRADY_E@SPCVXA.BITNET)
saw my query and replied by email. His company, DYJ Technologies,
was misidentified by Jane's as providing marketing services for
Gonetz. They are in fact consulting on the project, but not
marketing it. Anyway, he provided more detail about Gonetz, and
put me in touch with Vern Riportella, whose company is marketing
Gonetz services in North America. Vern is well-known to ham
radio operators for his involvement in AMSAT-NA and hamsat
technology generally.

To summarize a series of phonecalls with both men, the idea to
market this technology outside the Soviet Union came from
Soyuzmedinform (the All-Union Medical Informatics bureau of the

USSR health ministry). They originally saw it as a way to send critical health information to and from areas not served by conventional electronic communications, especially in rural areas and developing countries. But recognizing that this application might not generate enough money or traffic to pay for the system, they began thinking in more general terms. They organized a "Consortium of Small Satellite Constructors and Service Providers (COSSCASP) to adapt the Sextet technology and make it available worldwide. In addition to Soyuzmedinform, the current members of COSSCASP are:

NPO Precision Instruments: a Moscow-based organization that designs scientific equipment. They will design Gonetz's space and terrestrial segments, and develop functional compatibility standards for user terminals produced by others.

NPO Applied Mechanics: a large production facility based in Krasnayarsk, they build most of the Soviet Union's satellites. (By the way, NPO is a Russian acryonym for "scientific production organization.")

Network Services International: NSI is Riportella's company (see below for address).

Many aspects of the system have yet to be defined. They expect the orbital configuration ultimately to involve 5 or 6 orbital planes with 6 satellites in each plane. (Sextets are launched 6 at a time on one rocket.) That way, users anywhere in the world would not have to wait more than 20 minutes for a satellite to came into "view."

Gonetz is expected to serve both fixed and mobile terminals with a variety of digital modes, primarily email, but also fax and maybe voicemail. Apparently the digital links in the USSR's phone system use continuously variable slope delta modulation, so they are thinking of using that for voice in the Gonetz system. Riportella is arguing for linear predictive coding, as that requires much lower data rates. But they are still unsure what applications will be most attractive to users, and are assuming the basic service will be email.

It is also unclear what radio bands will be used, or whether a new international allocation is needed. Gonetz was originally planned for the 200-400 MHz range, but that presents some coordination problems with US military systems. The Sextet framework is apparently flexible enough that the radio issues don't have to be nailed down just yet. O'Grady said they will probably go along with whatever WARC-92 decides.

They hope to launch the first batch of satellites in the fourth quarter of 1993. Initially, all messages will be processed through ground stations to reach end users. The process will be fully automated. A computer will read the destination address

and determine which satellite provides the fastest delivery route. By 1995, they hope to have narrowband inter-satellite links working. That will eliminate the ground link in many cases, speeding delivery and supporting two-way real-time interactive channels. They anticipate that handheld terminals will communicate at 9600 baud, fixed terminals at 56KB.

Recognizing that the USSR has problems with quality control for consumer goods, they will encourage third parties to design and manufacture equipment for end users. All of the handheld units will be built outside the USSR.

No price schedule or rate card has been devised yet. Because the satellite technology is already mature, and Soviet launch services are relatively inexpensive, they expect the entire system to be built for around a billion ruples. Pick your favorite conversion ratio to figure that in dollars, but it should be less than half the cost of Iridium, and the user fees will hopefully be competitive with Orbcomm's.

For more information about Gonetz, contact:

>You need a '.' at the end of each name, i.e:
>
>g1yyh.   IN CNAME g1yyh.ampr.org.
>g1yyh.ampr.org.   IN A   44.131.1.8

The trailing period is needed for a fully qualified name (or nickname).
However, you shouldn't need a CNAME for "g1yyh." if "g1yyh.ampr.org." is in
the file. If you set your domain suffix in NOS to "ampr.org." (using the
"domain suffix" command), then the domain server should append this to any
host name that does not contain periods before doing a lookup.

The PA0GRI version actually extends this to handle names that include periods
but are subdomains within the default domain. For example, if
"mac.n5lyt.ampr.org." is in my domain file, and my domain suffix is
"ampr.org.", then I can use "mac.n5lyt" in NOS and the domain lookup will find
"mac.n5lyt.ampr.org.". This doesn't seem to match the behaviour of other DNS
systems I've seen, but it sure is nice to use!

Hi, there are 2 of us here in the Springfield, IL area running the new gri
NOS.  Both of us are having the same problem.  When someone connects via ax25
and then initiates a "chat", no data packets go from the local operator back
to the ax25 user.  What I mean is, I can keep typing but the rig never keys up
and what I type never goes to the other guy.  Also, in the session listing,
```

the send-Q shows a value of 0 bytes. So is this a bug? Is there a new
parameterI'm not setting or an old one that needs to be set?
Thanks in advance, Jay

We have used gell cells a lot in the past for backup of computer
systems.

Some gell cells will go to a high impedence state, where they
will no longer charge.   Try to charge them and they will only
take a few mills.

The manufacturer recommends that you then REVERSE charge them with
a current limiting supply (for a 5 amp hour battery) at .5 amps
MAXIMUM for 30 minutes. Then forward charge them at about .5
amps and they will recover much of their power, though not all.

We never sent a battery back to customers after they went hight
impedence, but they made great batteries for home projects.

Try adding the line:

DCDCONN ON

to the PG.TNC file. Also, make sure that pin 8 of the TNC's RS-232
is wired to pin 8 of the computer's.

Eh? I ship PKZIP and .Z (compressed) files over the air all the time.
As far as I'm concerned, I'm using a coding scheme the purpose of which is
to facilitate communication (by reducing the number of bits by 60% or so),
not to hide the meaning of the communications (the algorithms are public
and widely available). This makes it perfectly legal.

He didn't violate any amateur rules, and yes the packet BBS system has many large holes in it security wise. It seems that you may have inadvertently committed plagarism by indicating *your* amateur station's callsign as the source of the material from Usenet that you reposted through use of a From: line with your amateur station's callsign in your Fidonet posting. That's what's being picked up by the packet BBS software. The call N5PCA is considered merely a relay BBS by the software. The innermost From: line in the message is picked up as the originating station and will be shown as such in the source field. This is due to the way forwarding is done in the BBS network. It is a nasty security hole, but not the only one by far.

You could stop the problem by not identifying your postings to Fidonet with your amateur station's callsign.

I run a three computer LAN here MSYS<->890421.1 NET under XENIX <->PC running G1EMM 901130/1.4. The whole thing runs at 4800 baud (MSYS has a hernia trying to run faster than 9600 baud on any of the 3 ports on the XT. :-) and works reasonably well. Make sure you have told MSYS that the serial link is FULL Duplex and make your link timers very short. Other than that it should work fine. Oh... I'm still encapsulating the IP in AX25 over the serial line as (1) I can't make MSYS talk SLIP and (2) it allows me to run an internal NET/ROM network that effectively gives me a TNC attached to every Computer!

MSYS also can't handle VC mode. You *must* use Datagram mode.

>Can one also digi to another IP station via an AX25 digipeat?

Yes, It's the *major* way of routing around here at the moment. In MSYS you spell out the digipeater path ie;

```
ARP ADD VK1KCM-1 0 44.136.0.5 VK2RPT-5
        ^ Call
                 ^ MSYS Port
                      ^ IP address
                                 ^ Digipeater.  You can use more if needed.
```

>What does one need to do in order to make the SMTP mail forward in MSYS to
>work and talk to a station running the above mentioned version of NOS?

MSYS supports SMTP for personal mail and also for the one-way transmission of Bulletins. It's documented in the manual however I think the syntax in the forwarding file is;

```
-----
44 136 0 5 VK1KCM
VK1KCM
-----
```

Note the spaces.

Hi

Yesterday I saw a demo of NOS16 (the network O/S) and it was very
impressive.

SCC CIRCUIT

Unfortunately I don't have a TNC (I've been using PMP - a software TNC)
but I do however have a couple of spare 8530 SCCs and a prototyping card
for the PC. Does anyone have a circuit that I could use? Eventually I
could dream one up myself but I've had the SCC and the prototyping card
for the last 2 years - it's a pending project :-)

GENERIC SCC DRIVER

Also, in the NOS 16 documentation it made reference to a GENERIC 8530 SCC
DRIVER - where can I get a copy of this to act as a device driver for the
card once I get it built?

POSTSCRIPT VERSION OF KA9QBGN.ZIP

Is there a postscript version of the beginners notes for this software
so I get bold ...

Thanks
Giovanni - ZL2BOI

The other night, I was playing packet when a local station (AA6JQ!) connected to me. I noticed it sometimes required several retries to get traffic through to him; this shouldn't be the case, since he lives 3 miles from me

[Yes, it is true. Two days after moving into my Lancaster QTH, I discover that AA6JQ lives three miles from me, KK6JQ. His name is Harlan. Yes, I've been called Harlan on the air several times.]

Harlan is wondering what is wrong with his TNC; he cannot connect to most of the nodes he normally can. He thinks his audio is too low, so I put a whip on my HT and listen. When my station transmits, it sounds fine. I hear a blank carrier reply. Huh? About 80% of the time, my TNC fishes a valid frame out of the (as far as my ear is concerned) dead carrier.

The Am7910 is specified to require some small signal, like 10mV, to operate. Since we're so close, the S/N ratio was low enough to detect his inaudible tones!

I got a PK-87 at a hamfest (used) and it came with no docs. would someone
be kind enough to send me a copy, or at least a copy of the commands with
syntax so that I can use this unit.

thanks

Not to pick nits, but please note that this is legal only above 30 MHz.
Below that frequency you must be using Baudot (in its regular or AMTOR
flavors) or ASCII. You can't legally code your information any other
way. I think this is a dumb rule, but it's a rule none the less.

Who's to say that .ZIP files are not represented as "ASCII"? Are .EXE
files in "ASCII" format, and thus legal to transmit below 30MHz? If
not, how about if I uuencode the .EXE (or .ZIP file), and then
transmit the "ASCII" version below 30MHz?

Are we having fun yet?

I've received a plea for help from a school radio club in Warminster, PA.
They've received an HP-9816 computer system as a donation and would
like to use it for packet and for tutorial purposes. But they are
having trouble getting it all to work. They really need an "Elmer" to
guide them. Is there anyone who can help them get their system working,
particularly the serial interface to a packet TNC?

Please email me, I'll put you in direct contact with the school's
club advisor (a ham).

Thanks.

Look in the proceedings of the 8th Computer Networking Conference (1). You find
the description and schematics of the OptoPcScc board. This is a short IBMPC
interface bord with 2 times 8530. With driver software results this in 4
ports (TNCs)for a single board. You can chain multiple boards to create
a big packet node. All the standard rs232 ports are free for other use.

At many places you could find the file "sccprint.arc" version 5. In this file is more information and also the schematics in epson format. You could order printed circuit boards or component packets. (Ask for the current list).

The boards are curent in use with 1200 bauds v202 AFSK modems, 4800 baud HAPN modems and 9600 baud G3RUH modems. The G3RUH interface isn't yet in the sccprint.arc file. DD8ED is runing the board at 19200 baud with a modified G3RUH modem.

>GENERIC SCC DRIVER

>Also, in the NOS 16 documentation it made reference to a GENERIC 8530 SCC
>DRIVER - where can I get a copy of this to act as a device driver for the
>card once I get it built?
PE1CHL has written a very universal SCC driver. You coald find this driver in his version of NET and in NOS. In the attach you could configurate this driver for nearly any 8530 board. With PE1CHL version of net, a OptoPcScc board and a G3RUH modem you could work the Oscar 14 at 9600 baud broadcast.

Yes, you can uuencode the file and ship it as ASCII. The problem is that
"ASCII" is only 7 bits.

Two references presented at Globecom 90:

  W.C. Y. Lee, "Overview of Cellular CDMA"; also in May 1991 IEEE Transactions
  on Vehicular Technology.

  Gilhousen, Jacobs, Padovani, Viterbi, Weaver, Wheatley: "The Capacity of a
Cellular
  CDMA System", also in May 1991 IEEE Trans. on Vehicular Tech. (and Globecom 90).

You may also want to check Lee's book "Mobile Cellular Telecommunications
Systems".
I'm not sure if he covers CDMA.

Lines: 50

I think I may have found a solution for providing an Internet to local
AX.25 gateway, using nos.

Imagine a nos box with an interface to the Internet (ec0) and ec0
address a.b.c.d, and an interface to a TNC (ax0). Assume that the local
AX.25 IP network is 44.x.y.0, and the nos box also has address 44.x.y.z.

If we do:

```
route add 44.x.y/24 ax0
route add 44/8 ec0
```

then packets destined to 44.x.y.0 will be passed along ax0, packets
destined for 44.any.thing.else will be sent via ec0, and all other
packets will be dropped, thus ensuring non-Amateurs cannot transmit
via ax0.

The problem is, of course, to route the 44.any.thing.else packets
correctly over the Internet. To do this, we need to know about other
Internet-AX.25 gateways. If there is a remote nos box i.j.k.l gatewaying
stuff to 44.r.s.0, then we add the line

```
route add 44.r.s/24 ec0 i.j.k.l
```

Thus:

```
============== Internet ==============
   |                  |
a.b.c.d                i.j.k.l
  and                    and
44.x.y.z           44.r.s.t
```

```
        |                  |
        V                  V
     44.x.y.0           44.r.s.0
```

will each have routes

```
    route add 44.x.y/24 ax0      route add 44.r.s/24 ax0
    route add 44.r.s/24 ec0 i.j.k.l  route add 44.x.y/24 ec0 a.b.c.d
```

Comments, criticisms, suggestions to this newsgroup. People interested
in trying this out on a weekend please email me, to exchange the routing
needed as above.

Cheers, Warren vk1xwt

Are there any programme awailable for using PC/XT/AT serial port on
amtor mode? It should be possible to use handshake pins as TxD and RxD.
Baycom does that on packet, and only on packet.
I should like to use my rtty modem on amtor.

Is there a version of the KA9Q software that cooperates with MAC-TCP?
The idea is to use AX25 and SL/IP capabilities of the KA9Q package
from the MAC-TCP, so macintosh applications (like terminal emulators, news
readers, etc) can access the packet radio net.

thanks in advance

>Gary KE4ZV

What kind of 9600 bps system can one get for $120 + $99? Are people using

any kind of data compression like on the newer 9600 bps telephone modems?

Where does the future of full featured packet networking lie? Do you think
a modified TCP/IP system will take over? I am interested in the following:
1) Text message store and forward to Amateurs and 3rd parties
2) Large file transfer capabilities
3) Internet mail connection
4) Internet access

What system is my best bet? I really would prefer radio over telephone since
I want to help advance Amateur Radio, need frequent network access, and a
second telephone line is impractical.

Yes, NOS is getting far too large for MS-DOS. This is particularly
true with some of the "value added" versions that have extra features
not in my "base" code.

Your only real option is to go into the source file config.h and turn off
all the features you don't need in your configuration. Then remake the
net.exe file and you'll see that it has shrunk considerably.

There are two longer-term solutions for this problem: move to UNIX for

the fancy, large applications (this has the advantage that many of the applications are already freely available in the Internet/Usenet world and do not have to be reinvented for NOS), and recompiling NOS to run under a DOS extender on 386 class machines. I have not yet begun to work on this latter approach, but I am starting to get interested particularly since I've heard that there is a GNU C version for the 386 with a DOS extender.

My PK88 doesn't have the problem, but the standard fix is to twiddle with the trimmer cap on the crystal inside the TNC. That will move the birdie to another frequency.

Robin,

Yes, this is the most likely cause. To confirm it, specify a small
(e.g., 100 bytes) TCP MSS value and try to pull over a file with FTP.
If this works, then the problem is most likely a hardwired limit on the
size of incoming frames.

The original AX.25 spec limited frames to 256 bytes max, but many
TCP/IP operators run larger frames to improve the efficiency of large
file transfers. The original KISS code by K3MC could handle
arbitrarily large frames, but some vendor reimplementations have hard-coded
limitations.

I have a PK232, and I'm just starting to get into packet in a big
way, with the KA9Q stuff. I understand that there are a number of
mods that can be made to the PK232 to make it more reliable, etc.

Are these mods archived (uucp, I don't have ftp right now) somewhere, or

can someone send 'em to me?

Thanks!

Do you mean to keep the transmitter on continuously even in the absence
of input? Or if not, isn't there still a squelch-delay problem at the
beginning of a sequence of transmissions?

>If the repeater is built using a K9NG modem as an FSK regenerator

Interesting. I don't quite see how that works, but as I'm in the
process of putting together a 440-MHz regenerative repeater, I'd
be interested in the details. Why isn't the 1200-baud AFSK also
distorted?

So do I. Although I appreciate (and encourage) the Hubmaster idea,
I think there will always be a place for omnidirectional systems.
At a minimum, they are needed to serve the portable/mobile station.
And for the present, they are the easiest and most effective answer
to making a large improvement in network throughput.

Hi,

I am working on packet for more than two years in Japan. Files
outside Japan are coming through DU or YB. Recently, encoded files
(in R95 format) are coming very often. Here in Japan, we use the
ish.exe (a Japan originated freeware convert program) to create
encoded files. The program is so popular here both in wireless
and in wired communication societies, that it is extremely difficult to find
the program that decode R95 format files.

Could anyone give me information on how I can get the utility program that
handles R95 format files? If it is a freeware or a shareware program,
could anyone upload it in this newsgroup?

|> be possible anymore.

Yes, a few months ago I redid the whole param internals in NOS, and I
guess this has been picked up by PA0GRI. The idea was to allow symbolic

parameter names instead of forcing people to remember numbers, and to provide a much more general purpose interface for hooking on other control parameters. For example, with the param command you can now drop DTR to a modem by saying "param com1 dtr 0". I also wanted there to be a common "param" user interface for devices other than asynch ports talking to KISS TNCs - internal HDLC devices, for example.

There's a table of parameters that can be extended to include whatever special parameters a given device supports.

I don't completely agree with this. Several years ago when I analyzed the problem of optimizing maxframe, I concluded that it should be 1 on *any* half duplex channel, regardless of whether there are any hidden terminals. You should instead vary the *packet length* in response to changing bit-error-rate conditions. Of course, with the one-packet-per frame methods we have for encapsulating IP datagrams, it is not always possible to send large frames, so in some situations you might still do better by increasing maxframe above 1. But you could still do better on a good path by keeping maxframe=1 and enlarging the data field to the optimum value.

Note also that for the full-duplex repeater to really pay off, you need full duplex user terminals as well so you can detect collisions and abort transmissions before you've wasted a lot of channel time. Brian has been doing this with voice in his car for some time with a full duplex UHF transceiver - he can instantly tell when he's doubling with somebody through the repeater, or when he's in a bad spot. Works

like a charm.

Some thoughts on full-duplex digital repeaters in general:

Yes, they do indeed go a long way towards eliminating hidden terminals and the channel-access inefficiencies that they cause. But this does NOT necessarily make them the most efficient way to use spectrum. The problem is the same as with FM voice repeaters: a frequency pair is occupied over a very wide service area, even if the stations talking to each other are immediate neighbors.

For this reason I believe the problems of simplex channel access with omnidirectional antennas are still worth solving. A collection of "digipeaters", properly designed, could potentially carry more total bits/sec/square kilometer than a single high-level full duplex repeater covering the same area because of the possibility of simultaneously reusing the spectrum several times within the coverage area.

Now I use the term "digipeater" generically - I do NOT mean digipeaters as we now know them. Although they would receive and automatically retransmit packets on the same frequency, these "digipeaters" would have automatic transmitter power control, and they would use automatic routing algorithms that minimize the total RF energy expended on moving a packet INSTEAD OF minimizing the number of hops required. In other words, it is better (in the sense that it maximizes the total carrying capacity of the spectrum) to use a chain of many closely-spaced low power repeaters to carry your data than to use a few widely-spaced high power repeaters. Even though there are more transmitters in the former case, the total RF energy required (summed across all the repeaters) would be much less because of the smaller path loss between stations. More precisely, although the number of transmitters goes up inversely linearly as the repeater spacing is decreased, the RF propagation path loss goes down with at least the square of the repeater spacing, or perhaps even the cube or the fourth power of the distance given real-world paths with obstructions. This more than compensates for the extra transmissions.

As a result, "collateral RF pollution" to stations not in the immediate path of the packet would be greatly minimized, thereby allowing stations in those other areas to carry traffic at the same time.

When I worked at Hughes Aircraft, the gentleman who keeps that repeater
working right had an adjcent cubicle. We had several long talks over
lunch about just this topic. I was suitably impressed with this idea,
and wondered why there were not more packet _re_peaters (as opposed to
the digipeater).

Anyway, if anybody is interested, the 'GPP system is a regular Micor
repeater with a Bell 202 modem in the audio path, wired back-to-back for
regeneration via a few jumpers on the RS-232 plug. Big Deal.
Supervisory control is via a command decoder on another radio channel.

Yesterday, I downloaded what I understand is the latest version of nos. The
version I got is the modified version from PA0GRI (did I get his call right?),
and was the 05/31 version. If it helps, I got it from the ka9q area on
wb3ffv's bbs system.

now, I've run into lots of problems with all versions of nos regarding
memory, but these usually involve nos eating up RAM and never giving it
back...thus eventually locking the system and requiring a hard reboot. (If
anyone knows a fix for this, please pass it along.)

But, the problem I'm facing here is even worse --- with about 590 k of RAM
sitting there wide open (after mess-dos or 4dos, depending on which computer
we're talking about, was loaded), nose0531.exe refuses to run on both of
the computers I tried it on --- error message from each was to the effect
that the program is too large to fit in memory.

am I missing something here? did I perhaps assume incorrectly that this
executable (in mess-dos's .exe naming style) was for dos? or has someone
else run into this?

any help would be greatly appreciated.....

I have a UNIX system (Interactive UNIX on 386) connected to my TNC.
I have been noticing on the kermit logs that U5MIR has been occasionally
present. Does anyone have software that can work unattended on UNIX
that I can use to "work" his BBS?

Thanks

Hello there,
I want to use a IBM compatible PC to run packet radio, Is there software
available to run a packet station using a PC interfaced to the transceiver
via a FSK modem chip. If so where can I get a copy of the software?
(Public domain or shareware would be preferable). The software will need to
handle all the packetising and depacketising and the protocols.
If there are any good reference books with the packet protocols contained
could you list them for me.

I can be emailed at esx070%cov.ac.uk@uk.ac.nsfnet-relay

Many thanks in advance.

Can anyone recommend a transverter for use on 440 or 2meters ? Many manufacturers have stopped production. A phone and address would be greatly appreciated.

Hello Everyone!

You may know me as the person that has won the 10th broken mailer award! I am truly sorry for all the trouble that has been caused! I have just been made aware of the problem that was being caused in this newsgroup and have taken steps to correct the situation by stopping the gatewaying of this newsgroup until a solution has been found. I have notified the sysop of 106/88 that he is looping mail back through my system. Until I receive a reply from him, his system is no longer allowed to connect with mine. The reason that postmaster never received any mail was due a bug in that gateway code. Now that I have switched to a fully USENET-compatible BBS package, ALL OF THE POSTMASTER messages came flooding in! I was appalled and ashamed at the mess that this one message has caused! I truly apologize to the entire net for all the grief that my system has caused. This was worse than keying the mike on a repeater frequency and then going on vacation! I only hope that at least some of you on the newsgroup can find it in your hearts to forgive me. Had I been aware of the problem, I would have taken care of it immediately. If anyone would like for me to apologize to them in person, please send mail to root@farwest.fidonet.org and I will graciously apologize!

Hi!

I am trying to get a Packet Cluster going locally.
What I want is some basic info

1) What software is needed to run Packet-Cluster

2) Is the software available for different platforms,
   besides PC e.g. Amiga, C64, Mac etc.

3) I read somewhere that the Packet Cluster software uses its
   own protocol. If this is true, does it mean it will be
   incompatible with AX25 and TCPIP as the are at the moment.

I would be grateful for any hints/tips or pointers as to
where to get this info (magazine articles etc.)

John

>some other security measures) without a paddle.

There may well be a rule being violated here. If the packet posting
appears to be from you, and you did not send it (as opposed to being
originally from you which is not true either since you are getting it
from usenet) then the violation is something called "FRAUD". But
whether this case is such a violation is conditional. Being "From:"
you is technical correct from a perspective of where N5PCA got it.
Who it is from and who posted it are two different things.

The problem is that the identify of WHO POSTED IT as opposed to who
wrote it, etc (which is not you anyway) is not appearing in the packet
posting.

I, like you, and not yet active on packet. Given the mess it sounds like
I'm not so sure I want to be.

What you might do is a little editing when you crossfeed the postings
into the Fido HAM echo. Add a few lines at the top identifying yourself,
where you got the posting, and a statement saying something like:
"This material may be copied provided that full identification of
the person making the copy be provided with the copy".

The latest version is (and always will be, it seems) 5.14C, and it came out
in February 1990.

> Also - has anyone ever made a comparative chart on various BBS software ?
> i.e. RLI, MBL, AIZ etc. ? I'd be curious to see the pluses and minuses of
> each of them.

Not to my knowledge. It would be a daunting task, since there are at least
a dozen PBBS programs around, and some aren't very well documented. It
would be interesting to see though...

Hi there, I run a Fidnet BBS in Indiana (231/30) and have been grabbing the solar warnings off usenet and cross posting them in the HAM echo. A couple of weeks ago I got a call from a friend and he wanted to know when I got my packet gear set up. (I have no access to packet at this time) I was pretty puzzled over this as I have never been on a packet system before. He said he saw a message from me addressed to ALL@USA regarding the solar flare warnings. I asked he to capture it for me and after I looked at it. it was clear that someone had taken the Fidonet post and posted it on a packet system in Abilene Texas. The system was the NG5QH system but no where in the path and message header information was there an indentifying line to show who had actually posted the message. The from line showed : >KB9BVN@NG5QH

I started inquirying in the echo about this and N5PCA admitted that he had posted it but had violated no rules by doing so, he claims that he was logged in to the packet system with his own callsign....but the thing that bothers me is that now I am getting netmail asking why I do not respond to messages people are leaving me on packet. (GREAT)

Also a friend of mine K9ML checked the white pages on packet to see if I was listed there and sure enough, it shows my home BBS as being the NG5QH system in Texas. (I live in Indiana).

Is this all legal?? If so, then packet radio has a VERY LARGE HOLE in it. What is to keep someone from logging on under their call sign, and posting using another callsign. If the message content was illegal then the FCC is going to come after the BBS op and more than likely the callsign indicated in the FROM line. If the BBSOP doesn't have his logs to prove who posted the message than an innocent person could get into some real shit with the FCC.

N5PCA and a few others keep telling me that they didn't violate any rules, I disagree with them, but since I do not use packet yet I am not 100% up to snuff on the rules. I know that on my landline BBS that I am legally responsible for the posts and information contained therein, if an imposter posts something illegal I'm up the creek (I voice validate everyone and use some other security measures) without a paddle.

So what's the deal?

We are interested in setting up some point to point links running
64kbps (for digitized audio). Does anyone know what is available for
this?

If we could get wide-band radio equip (don't have time to learn and
build GHz range equip), the rest could be done. Alternatively,
high bit rate modems over narrow band would be okay. Has anyone
done work on high bit rate modems using techniques that assume a
very good SNR?

Well, since no one else has taken a crack at answering this yet, I'll

throw in what I know.

In article <22BBCC67202023A7@ul.ie> 8909296@ul.IE (John Barry EI7DNB) writes:

>1) What software is needed to run Packet-Cluster

Software of the same name from Pavilion Software. Since I'm not a sysop,
I haven't paid attention to their address, the cost of the package, etc.
Perhaps someone else out there can supply you with the necessary details.

>2) Is the software available for different platforms,
>   besides PC e.g. Amiga, C64, Mac etc.

I'm sure that the BBS software itself is only available for MS-DOS
machines, so sysops would need that. Users, however, can use any
normal packet-radio software. (I use the KA9Q package on my Macintosh,
for instance.)

I believe there's also a special user program called "Cluster Companion"
available for MS-DOS machines that gives you a few additional features.
But it's entirely optional. Regular packet programs work just fine.

>3) I read somewhere that the Packet Cluster software uses its
>   own protocol. If this is true, does it mean it will be
>   incompatible with AX25 and TCPIP as the are at the moment.

You've been told incorrectly. It's regular AX.25.

>I would be grateful for any hints/tips or pointers as to
>where to get this info (magazine articles etc.)

I know the DX Magazine has done stories on it, and I think Gateway
(now incorporated into QEX, both from the ARRL) has also.

Very much agreed, but how do you convince users to deal with two antennas, and
two feedlines, and so forth? I'm finding this enough of a roadblock that we
are seriously considering going inband for our 56kb repeater, and punting the
/CD entirely...

Yes, sort of. Some folks in Japan were experimenting with ATV tx and rx gear lashed up to a 10Ghz link built around a pair of Gunn units and lots of plumbing about two years ago. I don't know how far they got, they were trying to do 10Mbit/sec, and the ATV-derived modulators weren't that fast.

Are there any packet maps/pbbs lists available online?

A friend of mine will be driving across the country this summer and
we would like to stay in touch via packet. Getting messages back here to
Pittsburgh is the easy part; he can log into PBBS's along the way and send
the mail.

The problem is getting messages to him. With 2 drivers they plan to be
driving most of the time, and I will need to predict what PBBS's he will be
at in advance.

There are quite a few multi-band antennas on the market, and you can get
crossband splitters to go with them. You still need two radios (unless you
use one of the newer duplex dual-band radios) but at least they can
share one feedline and one antenna.

I need the manual for a PK-87 TNC. I picked one up at a hamfest and it didn't
have a manual. Especially needed is the command list so I can use the darn thing.
I was told it would be "just like my MFJ" but found out otherwise when I got home.

Thanks

Greetings,

I'm interested in getting my amateur radio license. I'm going to be taking a year off from college and riding my bicycle in the southwestern U.S. and Mexico. I'm interested in taking a radio with me for many reasons. First of all it would be a good safety measure. Secondly I have always wanted to get a license. Thirdly it would be nice to have local contacts in the areas I want to visit to direct me to places to see, things to do &c. Fourthly, riding bike for 8-10 hours a day often gets monotonous in deserts, plain states &c. And number five is because I would like to maintain my connection to the Internet if possible so that I can relay some of my projects that I'm working on without having to use phone lines. (We will be carrying a notebook computer.)

I have several questions that I have to address. First of all, are there many hams in that area? How about repeaters and gateways? Can I rely on a good two meter setup, or should I look for something else? How portable can I be? Has anyone else done this? How do I mount an antenna on a bike with some degree of stability? What about crossing into Mexico and other south american countries? What type of arrangements must be made? Can I somehow go solar powered without much modification to equipment?

If you have answers to these questions or have something that I might use, PLEASE drop me a line. Thanks much.

Jonathan Bucki

St. Olaf College

P.S. If anyone living west of the Mississippi and north of Panama has any available back yard space for two, poor college students on bikes, drop me a line. We do windows!

Does the KPC2 have the hardware time-out timer needed for unattended operation?

I like the kantronics stuff, and realize a timer would be easy to add, but
it's even easier to spend $30 less for a TNC2 clone if Kantronics is still
too cheap to build in a timer.

I have a KPC2 and I can say from experience that it doesn't have a hardware
timer. I once came home to find the TNC in a wierd state, continuously
making the radio transmit a single tone "beeeeeeeeeeeeeeeeeeeeeeeeeep".
The radio took it no problem, but I'm sure that the other users of the freq
in my area were less than thrilled with this tone jamming the channel.

Only happened once in a year's time.

I have been working on porting the KA9Q TCP/IP networking stuff to Coherent.

I was wondering if anyone else has succeeded, and/or what Makefile should I
start with.

I have *most* of it compiling, but none of it working (yea, I know!!??)

I am running into weird problems, and bizzarre crashing. I am trying to
talk to a DOS system running the same code (well the dos version of the
same code TCP/IP Plug and Play version).

I am almost stuck, but not giving up. Any hints would be appreciated.

Thanks

Subject: RE: Deep cycle batteries
Keywords: deep cycle ARE better
Message-ID: <13491@pt.cs.cmu.edu>
Date: 18 Jun 91 05:03:50 GMT
Organization: Carnegie-Mellon University, CS/RI
Lines: 52

Car starting batteries are designed to provide a large current
(hundreds of amps) for a few seconds, and then be recharged fully. They
are optimized for very low series resistance, not for long discharge periods.

Deep cycle batteries are designed to provide a steady current for hours.
Pound for pound, a deep cycle battery will provide a lot more usable
amp-hours than a starting battery of the same size. The "9 volt" number
quoted on the net refers to the fact that deep cycle batteries can take
more abuse than starting batteries and still perform. The amp-hour rating
assumes a load that will discharge the battery in 20 hours, with discharge
being defined as the loaded voltage dropping to 10.5 volts.

Deep cycle batteries come in two flavors. Liquid electrolyte batteries,
including "maintenance free", must be charged by a complex cycle if their
full amp-hour potential is to be realized. This cycle includes charging
at 13.8 volts, with a brief overcharge period of 14.4 volts. The deliberate
overcharging produces gas generation which helps to clear the plates of
sulfate crystals.

A more expensive type of deep cycle battery is the immobilized electrolyte, or
"gell cell" type. This type has the following advantages:

1) Easier charging. A constant voltage charge at 13.8 volts
   will charge a gell cell to its full amp-hour capacity.

2) Protection from abuse. A gell cell stands up to abuse better
   than a liquid electrolyte battery (see below).

2) Operation in any position. Gell cells can be operated in any
   position, including upside-down. People like me who sail small
   boats appreciate this property.

There are 2 things that can kill any lead acid battery. The first is
to let the liquid in a non-sealed battery drop below the tops of the plates.
The second is to discharge the battery below 10.5 volts and leave it that
way. Gell cells are a little more immune, but should be recharged within
a month of use.

Source: "Living on 12 Volts with Ample Power"
         David Smead & Ruth Ishihara
         International Marine Publishing Company

This book is an excellent reference on the properties of lead
acid batteries and alternate energy systems. It is written
by and for cruising sailors, who need to get every amp-hour per

pound out of their batteries. The author has done extensive testing of different types of batteries.

Rumor has it that the "powers that be" in the FCC are uncomfortable with what they perceive as the building of a "common carrier" network on the ham bands -- in the form of the packet BBS system (and other related packet systems).

Indeed, the situation is starting to look very much like that of about 20 years ago, when one A. Prose Walker, W4BW, decided he did not like FM repeaters and pushed through highly restrictive rules. For those of you who were not around, these rules required the special licensing of repeaters (with WR callsigns). Ordinary stations were not allowed to do anything that looked like repeating. Applications for repeater licenses required highly detailed system diagrams, with designated "control points", designated control operators (who had to hold special "control" licenses) and the like. The linking of repeaters was prohibited, as was crossband operation and a whole slew of other potentially useful activities.

After a few years Mr. Walker retired from the FCC and the draconian rules were lifted, but not until after quite a bit of damage had been done.

Now we seem to face a replay of history with respect to today's leading-edge amateur technology, packet networking. We've seen the opening shot in the form of the infamous "900 number" citation and the FCC's apparent intransigence on holding every licensee in an automatic network responsible for message content.

I thought it might be useful to draft a "white paper" to argue the case for a highly capable amateur packet radio network, because the

FCC Private Radio Bureau appears unable or unwilling to appreciate the fact that packet networking is just as much (or more) in keeping with the Basis and Purpose of the Amateur Service as are more traditional activities such as ragchewing, DXing, contesting, building transmitters, etc. To me, building the biggest, fastest and most reliable and efficient packet network we can is amateur radio's "manifest destiny". It's so obviously the right thing to do that it's hard to exhaustively list all the reasons why. One might as well try listing all the arguments in favor of motherhood and apple pie.

Therefore I would like to solicit items for this white paper. At the moment, I am looking for BRIEF points that I can expand into full sections in my paper. All should support these two basic ideas: 1) building an amateur packet radio network is entirely consistent with the charter of the Amateur Service, and 2) even a fully automatic, operational amateur packet radio network would not be a "common carrier" by the standard meaning of the term.

To get things started, I thought I'd put out a few points myself.

1. The "leading edge" of radio communications technology no longer deals entirely with the design of radio transceivers. It now deals instead mainly with the problems of organizing those transceivers into cooperating networks. If amateur radio is to stay current with the field of radio communications and produce technicians and engineers who understand today's communications systems, it too must do networking.

2. A "common carrier" is defined as a commercial entity that must provide its communications or transportation services to anyone willing to pay its tariffed rates. Since amateurs are a) volunteers who are free not to provide their services and b) cannot by law accept compensation, it is impossible for amateurs to create a "common carrier" network even if the amateur technology were otherwise identical with that used by common carriers.

3. By replacing a single pair of stations with a network of several stations between the same two points (among others), it becomes physically possible to use higher frequencies (e.g., line of sight links using VHF, UHF or microwave instead of ionospheric routes requiring HF) and lower powers (because of the smaller inter-station separations and higher antenna gains). This promotes the more efficient and effective use of RF spectrum, particularly through spatial reuse. Given the scarcity of the spectrum and the amateur's mandate to experiment, the development of amateur networks as a means of promoting more efficient use of the spectrum is clearly justified.

4. Automatic networks, particularly operating on line-of-sight paths at VHF and above, are much more reliable than point-to-point HF links, making amateur facilities much more useful in event of emergency.

5. The network itself has proven extremely useful in support of other, more traditional amateur activities by disseminating bulletins,

coordinating the efforts of like-minded amateurs at some distance from
each other, and promoting the broader discussion of policy topics of
interest to amateurs.

Those are just a few of the possible points I could make. Any others?

Phil

The cheapest TNC on the market has a list price of $129. The best TNC on
the market has a list price of $129. You can't lose.

>   2) Use outboard TNC if possible.

Sure, no device drivers to write. Let the little Z80 do the hard work.

>   3) Use PC for processing horsepower.

Not much processing left to do, the Z80 did all the work. All you have
to contend with is a ASCII stream coming in the serial port.

>   4) Use XENIX for the operating environment. I use
>   XENIX the most and the packet software could be

Again sure, Unix likes to deal with streams of bytes.

>   a) XENIX would mandate code that was written in C or
>   assembler but that used standard i/o functions
>   (although I suppose I could write a device driver).
>   Sources would probably need to be available.

You could just use cu -l tty00. Should work as good as any dumb terminal.
No programming required.

>   5) Have the PC be a "private node" or "BBS" so that

>   to connect as a terminal to read them. I'm not sure
>   if my terminology is quite correct here.

Ah, you want a personal mailbox. This feature is already available in the
current release TNC code. Again you can let the Z80 do the work. The TNC
can hold up to about 10k of mail before overflowing.

>   If I can run the software under XENIX then I can

As long as you leave monitor mode turned off in your TNC this is automatic.
No extra charge.

> So, Is this possible? How much of it is? Thanks very much for
> your help. I hope to be making a racket with packet soon!

What you want to do requires no programming and is built in to the
cheapest TNC on the market. By enabling KISS mode in the TNC and
running the KA9Q TCP/IP code for Unix, you can do much more advanced
things. But save that for later. Just hook up a regular TNC and use
cu to talk to it until you get a better feel for packet.

Hello!

I am interested in getting my Ham Radio liscense, however, before I do so,
I need to know if it would be worth getting before I take a long trip to
the Southwest or after I do. What is the Ham "population density" in the
southwest and Mexico? I will be travelling by bike so most likely I will
only be able to operate a 2 meter rig. (Unless there are other _really_
portable units available for 10 meters &c. Are there?) I would like to get
my liscense before I go if I can be assured that it would be worth it and
that I won't be hauling around extra pounds of gear with no one to talk to.

How about repeaters in the southwest? Are there many? One of the reasons
I would like to have a 2m rig because then I can communicate via packet
radio with a computer at home. (I will have a notebook computer with me.) Is
this possible? How about Internet access while I'm on the road?

What kind of problems (if any) pop up when travelling across the border into mexico? Do I need to prearrange something?

One of the greatest need that a radio would fulfil is communication. (Obvious, no?) I will be on the road with a friend for about 9 months. During this time I'd hate to have a problem like a broken leg and have to _ride_ 60 miles to find a desert pay phone. Another reason is because it would be really nice to have "contacts" on the way.

However, if the population of hams is faily low, I think that I will wait until sometime after the trip to make the expenditure.

I believe there was a rather long list of all known Amateurs on packet along with their home BBS's called the "White Pages".
Is this file available somewhere via the Internet ?
Any info on the subject would be greatly appreciated.

Just honesty, really... Nothing more than what stops someone from getting
on HF sideband using someone elses call.

Well thanks for reading this, it is my last hope.............

I have been running TCPIP (both g1emm v1.6 and g1yyh v2.5) over the
past few months and have been having a persistant problem.

I use a TNC-220 from paccomm (v1.1.6c1) firmware, All and I mean all of the
other users in the area are using AEA PK232`s.

My problem is that the 220 is persistently missing packets during an
ftp or telnet transfer, and I just cannot work out why. I have spent ages
trying to elimate possibilities, the station comprises of :

Amiga/PC XT clone (does not make a difference)
PACCOMM TNC 220
ALINCO ALM 203-E H/H (or a yeasu FT290R does not seem to make a diff)
Indoor Slim Jim antenna (student flat!!!).

The symptoms are that in kiss mode the DCD light comes on to register
the traffic on the channel but the con light does not flash to indicate
that it has been rx`ed correctly, consequently the machine at the other end
contunues to backoff and i get stuck. All AX25 sessions work OK that is what
I cannot understand because to my mind IP sits on top of it.

Which brings me to the conclusion that the TNC does not like long packets,
maybe the buffer gets full....etc I`m only guessing, A UUEDCODED ASCII request
(I.e. DU xxxx) also gets stuck.

I hope its something straight forward but this is driving me crazy...

I phoned the UK PACCOMM importer who said to try three things :

1. Make sure AWLEN 8 and PARITY 0 before going into kiss mode.
2. Reduce the Compute to TNC baud rate to 2400
3. Cry.

None of which makes any difference, I have also tried using a BSX2 (TNC2 clone) with the latest TAPR 1.1.7b code but still no joy. Is there something so different in the PK 232 (I understand it still uses a Z80 unless the input side is different)

Has anyone come across this problem and if so do you know of a fix.

P.S Please not that the other station is 5 miles away and we have a clear frequency.

Please HELPPPPPPPPPPPPPPPPPPPPPPPPPPPP!!!

Thanks

Robin GM4YED

Hi,
we at our University-Network are using a so called 'wizard-code' to
protect our machines.
Here a short explanation:
After logging in (with or without password) two line like the
following appears:

```
     1  2  3  4  5  6  7  8  9  0
     4  3  8 10  5  4  3  9  1  2
```

The first line is for reference only, the second one is for every login
differently produced by a random generator.
In your mind you 'hide' a secrete formula insted of a password. The formula
may look like '2*8-1+k3'. With the second line from the wizard-generator
and the formula you have to calculate your password for this session, in
the example above this will be:

2.th number(3) * 8.th number(9) - 1.st number(4) + 3 (constant) = 26

If the choosen formula is not too simple, it would take a long time
of scanning to guess it. It is even possible, to block the account
for a certain time, if the answer is n-times wrong...

Of course, before you may use this feature, you have to exchange the
formula with the sysop of the bbs. Could be, that will be a problem...

The code for this wizard-protection is not in the public-domain,
but a thing, this little hack is not a hard work...

Greetings, Klaus

Not easily. I'm pretty sure the modem standards aren't the same, and
getting a modem which expects to talk in full-duplex mode to talk in half
duplex mode is non-trivial. Besides, even if you _did_ get it to work, you
still need the PAD (Packet Assembler/Disassembler), to have the rest of the
TNC. Why not get a kit from somebody or build one fron scratch?

Hello,

In the NOS.EXE from 0423 (PA0GRI version 1.6h) the param command seems to
be broken. If I do a 'param ax0 6 65' to disable the blinking led of my
DTNC-1 (Dutch TNC-1) the led doesn't stop blinking as it does with the NOS.EXE
from 0201 (PA0GRI version 1.6e). So the '6 65' doesn't go to the TNC anymore.
If I give the command 'param ax0 75' to set the DTNC-1 into KISS mode the
answer is: 'Parameter 75 not supported'. In the previous version this gave
no problems.

In the source listings I have seen that the code has changed but it is not
clear to my why it changed and how it works now. In the previous version
I could at least send any character I wanted to the TNC. This seems not to

be possible anymore.

Any clues?

Greetings, Robert van den Nieuwendijk PA3AMO

The 'hidden transmitter' problem will be with us forever; in a classic client-server system, something like Hubmaster is a way to solve some of the grosser deficiencies; but in a true peer-to-peer system its no help.
I rather like the idea of a dual-channel system with the second channel being used to send 'back off' messages in case you get the transmitter-collision problem; this only works if you have true full-duplex capability and the TNCs etc. can stop sending in mid-frame on receiving a 'backoff'. (Maybe just de-key the TX and let the TNC carry on till its finished?) Put the supervisory channel on a different frequency, (remember that the supervisory channel would only ever carry 'backoff' frames so the chance of a collission there is much reduced).
Just thoughts.....

   If we limited amateur radio to only peer-peer sytems I believe much of the utility of the nbfm HT would be lost (no repeaters).
  It seems to me that in the real world higher performance amateur communications made possible by effective use of resources increasingly require coordination and cooperation.
   If in striving for peer-to-peer systems you would seek increased autonomy ("I did it my way", "rugged individualist" etc) then I think that is counter to the development of a shared resource like a wide area network.

In a very real sense, a second, "control channel" is a jointly owned resource used to facilitate communication.

  Just a thought.

Converting a modem to a TNC is sort of like converting a child's
trolley to a motorised vehicle. They both need a body and wheels but the
the main bit (the motor) is missing :-). In the case of the TNC, the
main bit is the microprocessor and it's control program to do all the
packet encoding and decoding.

If, on the other hand, all you want to do is USE the modem to give you
a packet station, then this should be possible, if you have either a
PC or a C64 computer. There are two programs for a PC that will do
all the packetising and de-packetising for you, all you need is a
dumb modem and a radio. These program are called PMP (poor man's
packet) and BAYCOM. I prefer PMP but BAYCOM seems to have more
features - they work. I've been using PMP daily for the last 15 months.
For a C64 the program is called DIGICOM.

Unfortunately, I don't have the IP addresses of any sites
that have these programs. If you get stuck (and no-one else obliges
with the FTP addresses) then let me know and I'll either find them
for you or mail you copies of the programs.

Cheers
Giovanni - ZL2BOI

OK, then, set it up so that as the packet is beng received, it also regenerates
it back to the output. This assumes, of course, that the node is full-dux.
If the node hears a scramble packet in the middle, immediately stop sending
the regenerated packet and sent out an abort frame.

Hello everyone, I have just seen an advertisement in the April issue
of Radio Communications about a new TNC/modem made by AEA, model number
DSP2232. Can someone send me some information on this device, ie what
are its capabilities, price etc. Is this the replacement for the PK232?
Thanks in advance...

A very interesting and informative article. Pity it is not legal to
pass any message in anything but plain unencrypted text, using the
defined transmission formats.

IE WE can not use any key or cypher on the packet network.

Now it may be that US rules allow this, though I should hope not
as any business could use the bands for any purpose and no-one
would be able to tell, a short cut for PMR ?

Don't know if the other message/article was posted here, so I'll request again. Does anyone know if a PACKET (either AX.25 and/or TCP/IP) gatewaye exists between PACKET radio and Internet? If so, could someone please state where it is located? If not, why has this not been performed? Additionally, what would be needed in getting set up?

We have some full duplex regenerative packet repeaters here in Arizona
for exactly the purpose of eliminating the hidden transmitter problem.
It works!

Recognizing the scrambled packet in the middle doesn't really do any
good, since the node is jammed until both senders stop transmitting.

I think that you totally missed the point. The discussion is based on
how to AUTHENTICATE that the user of a BBS is actually who he SAYS
that he is. This was not discussing encryption of the message TEXT,
but how to build a system where you COULD hold a person responsable
for what HE PUT IN A BBS! Most especially messages of a COMMERCIAL
nature!

Recently in the U.S.A., a ham DID insert into a BBS a message that was
deemed COMMERCIAL by nature by the FCC. The BBS's that automatically
forwarded the messages were also held liable, but the person that had
entered the message claimed "someone else was using my callsign" and thus
got off the hook. Impossible to say for sure whether it WAS the person
who's call was on the message or whether it WAS someone else.

This message string discusses ways to avoid that in the future.
This would not have any intention to (nor would it) encrypt or obscure
the message CONTENT so it should not be seen as ENCRYPTION per se.

Sorry to see that you have rules so strict over there. I guess that
you will never be able to use the 56KBS Heatherington modems since
they use a randomizing method with published key that you all would
probably consider "encryption".

It's a shame when the rules inhibit innovative development don't you
think?   We ought to change the rules .....

Since I have had enough direct inquiries about the Ramsey 2 Meter transceiver,
I think a general post is in order.

The Ramsey kit is as follows:

2 Meter Amateur PLL Synthesized FM Transceiver - Model FTR-146

I paid $125 + tax at the Dayton Hamvention for it - I don't know if that was
a show special or not.

It is basically a 2 Meter radio with the following specs:

(This is taken from Ramsey Publication no. M146FTR - Kit assy and instruction
Manual for the kit - Copyright 1991 Ramsey Electronics)
(All rights, credits go to Ramsey Electronics...)
Hopefully I didn't insert any typo's...

Freq Range: 144.000 to 147.995 MHZ
           (actually its 143.000 - 148.110 Mhz, but NOBODY would
         transmit out of band!   8-])
Tuning: Diode programmable PLL synthesis
PLL Programming: 5 KHZ steps
Transmit Offset: Simplex, +600 KHZ, -600 KHZ
Mode: NBFM
Packet Operation: 5 pin DIN connector for TNC cable
Power: 13.8 VDC +/- 10% (negative grounding)
Current: 1.5 Amps Transmit
       200 ma Receive (no signal)
Antenna Impedance: 50 Ohms

Microphone Impedance: 500-600 Ohms
T-R Switching: PIN Diodes
PTT Circuit: Solid State
Semiconductors: 4 IC's, 26 transistors, 25 diodes (plus programming diodes)
         (and LOTS of inductors, capacitors and resistors!)

Transmitter:

Final Power Output: 4-6 Watts
Final Output Stage: MRF237 or equivalent
Modulation: VCO
Maximum freq deviation: +/- 25 KHZ., +/- 5 KHZ NBFM
Modulation Distortion: less than 5%

Receiver:

Circuitry: Double Conversion superhet
             first IF: 10.7 Mhz
          second IF: 455 Khz

Sensitivity: 12 db SINAD less that 0.35 uv.
selectivity: +/- 7Khz (-6db)
               +/- 15 Khz (-60db)
            4-pole crystal filter at 10.7 Mhz

Squelch sensitivity: less than 0.25 uv.
Audio output: More than 2.0 Watts (!)

Its basically a TRUE Amateur Radio hobbyist's radio.

Where to get one you ask? Well...

Ramsey Electronics, Inc.
Amateur Radio and Hobby Kits Department
793 Canning Parkway

Phone: (716)924-4560   FAX: (716) 924-4555

No, I'm not an employee of Ramsey, nor am I getting anything for sitting
at a terminal on a Sunny Sunday Afternoon and typing this. I just think
that this is a GREAT radio kit and a lot of fun to build and use!

For the past few weeks, I have been assembling a Frequently Asked Question
(FAQ) list for this newsgroup (rec.radio.amateur.packet) and the
packet radio mailing list.

This message is being put out to inform everyone that the FAQ is
on the way and I plan to get it done in 2 weeks.

     Does anybody have the straight scoop on how to go about interfacing a dumb (or Hayes-compatible, for that matter) 1200 baud modem to one's HT and PC, for use by PMP or baycom? I have a PC and the PMP code, and what I believe is a working 1200 baud modem (flea market special, don'cha know:-), but lashing them all together seems to leave a lot of mental loose ends. Particularly on the modem <-> radio side, since the modem expects to see Ma Bell out there...

     Any tips gladly appreciated. Followups to this group.

Can someone email me the site(s) for ftp'ing the PMP and Baycom apps?
Also, are these just "drivers" ie can I use them "underneath" another
app, say NOS on a pc? Or are they stand-alone comm programs? I'm
looking for a cheap KISS modem, in effect, since NOS will do all of
protocol bundling for tcp/ip. So I don't need ax.25 or ROMS or much
at all.

How is 56kbps (commonly) achieved for packet radio? I have heard of
the "Grapes" modem used in conjunction with KA9Q for high speed
TCP/IP on the 220mHz band.

Is some kind of KISS mode TNC needed for this setup, or does the
PC need a special high speed COM I/O board of some kind?

There is some interest in my area (mid MO) in building a state wide
high speed packet network. Most of the folks are thinking 9600 bps
but I'm wondering why we shouldn't go further and use 56kbps instead.

I'd appreciate any comments about the radio and PC hardware needed for
56kbps. Perhaps the 450mHz band would be better than the 220mHz band.
Perhaps some kind of spread spectrum at 900mHz under part-15 at
100+kbps would be better still!

Thanks.

Come now. The hidden transmitter problem pretty much disappears when you go to a duplex system. The network switch needs to run full duplex on the MAN/LAN frequency, and the user's transceivers need to run split frequency, but they do not need to run full duplex. This operation is almost identical to the way voice users work. The only addition that makes things nice is for the network node to not only "echo" the packets back, but to send a "digipeated" copy as well, after the user quits transmitting. This is only needed in the case where the user wants to connect to himself. The digipeat function can be made intelligent so that it occurs only when the user actually requests it. There are still a few delays in the system making it slightly slower than direct point-to-point, due to transmitter key-up times. The system works quite well, by the way. If you visit Atlanta, GA, try out the PEG/GRAPES 146.13/73 machine (call KD4NC-1).

>Bell out there...

Before the preliferation of relatively cheap TNC/modems we actually did use converted modems for packet communications. They worked well. There was very little that was needed to convert them, just remove the phone line couplers. Of course they were Bell 202 modems. I don't believe that Hayes ever made a 202 compatible modem. The point is that Bell 212 (the commonly used standard for Asynchronous phone line use) is quite a bit different than the Bell 202 modems hams use on slow speed packet. It is definitely not worth while to try to convert the newer modems. Most are based on IC technology where everything is in one chip. Using 2206's and 2211's, Bell 202 modems are CHEAP.

So what are the differences? The frequency tones, primarily. Bell 212 uses a full duplex pair to talk both ways simultaneously. Bell 202 is one pair, simplex only.

I'm not trying to discourage experimentation, just lower the frustration level...

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS

FLEA all SUMMER at MIT
Sunday, June 16, 1991
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 400 sellers and
free, off-street parking for >1000 cars!

Buyers admission is $1.50 (you get 50c off if
you're lucky enough to have a copy of our add)
and sellers spaces are $8.00-each at the gate
or $5.00 if mailed by the preceding 5th.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

!! RAIN or SHINE !! Have no fear of rain, a covered
tailgate area is available for all sellers (6'8" clearance).

Talk-in: 146.52 and W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)
Harvard Wireless Club (W1AF)

Has anyone tried to use ATV equipment to send high speed
digital information, along the lines of the "back up
your computer disk on your VCR", by making a modem that
outputs something that looks like a standard TV signal?

Should be good for over 4 Mbps, and if you work it right
you can put your ID out as a visual signal.

I have been running a Packet Radio <---> USENET Gateway for the past couple
of months. Thus far it has supported limited e-mail transactions and has
supplied articles from the rec.radio.amateur group to the local Packet
Bulletin Board system.

In the interest of publicizing the Amateur Radio Service and provide e-mail
access between people on the Network and their friends on Packet Radio I
have decided to notify you of this gateway. This is a volunteer effort on
my part, and subject to my available time.

Transactions initiated in the Amateur Radio Packet System are automatically
sent over the Network. Packet Radio message handling has limited the naming
for messages to six upper case and numeric characters. I maintain an alias
list to Network addresses.

Transaction initiated on the Network Side, if confirmed to be an Amateur Radio Operator, will also be automatic. Otherwise, they will be manually handled since the rules require that any transmissions on the Amateur Radio Service be initiated by an Amateur Radio Operator.

Mailing to the packet domain can be as simple as mailing to my system using the Call Letters (or name) of the destination amateur. For example: ve6aqp@ve6mgs.ampr.org. I have Rosters for Alberta, so a message to me stating the name of the operator can be sufficient as I will look up their call letters. If the Amateur is not on packet (anywhere in North America), I will endeavor, under the free National Telegraph System (NTS) instituted by the Amateur Radio Service, to get the message off. In that case, I recommend that messages be kept short, 25 Words or so, and that a phone number and address be included in the text of the message. No delivery times are guaranteed ...

I will also accept for sale and wanted items to be placed into the Amateur Radio Swap and Shop (on Packet and over other modes of service) if they are related to the Amateur Radio Service. Due to the rules of non-commercial activities on Amateur Radio, the scope of Amateur Related is fairly limited I must warn you. Scanners, SW, Transceivers and Computers ok, No price is quoted, only a contact name, phone or address. Many non-amateurs, SWL and Scanner types, do listen in on the voice Swap and Shops.

Drop me a note if you have any questions about the gateway or the Amateur Radio Service.

Ciao, Mark Salyzyn mark@ve6mgs.ampr.org Packet:VE6MGS@VE6MC

I just upgraded to 4.0 last night. From 2.85. It looks like there
is good stuff in the 3.0/4.0 upgrade. Especially the simplified
PBBS access that went into 3.0. The question I have is...Is there
any software that uses host mode other than the PC program from
kantronics? Has anyone done a mac program that uses host mode?
I'd really like to be able to work rtty while monitoring packet
and it looks like its technically feasable now.

  Why is the hidden transmitter problem with us forever? There are
topologies where there are no hidden transmitters to be concerned with.

>I rather like the idea of a dual-channel system with the second

>'backoff' frames so the chance of a collission there is much reduced).

When designing an extension, consider the existing user base. How will anybody be able to use this scheme?

A better approach is to make the entire topology visible to all nodes; you can do this by taking a standard voice repeater (on a 600kHz) split, and transmitting through it. No digipeating, mind you; there's no need since everyone in the topology can hear you. This also means that all nodes in the topology can willfully defer when the channel is busy. A better approach is to hook a modem in between the receiver and transmitter to regenerate the data; the next thing is to use a coherent DCD to trigger the COR. This arrangement works perfectly with existing hardware and is relatively simple by itself.

The N6GPP duplex repeater is one such configuration; the only thing that causes collisions there on a practical basis are radios with slow transmit delays; between the time a radio is keyed up and RF is emitted, one is exposed to a collision. I enjoyed reliable, efficient coverage to a very large area using GPP.

The point of enhancements is not to make things more complicated because you can; the point is to get enhanced or additional functionality with the least overall additional complication.

Is this really true? I ask the question in all sincerity because
I wonder about stations on the repeater fringe that communicate with stations
beyond the repeater fringe. What about that case? Isn't there then still a
hidden transmitter? I understand that there will be *fewer* hidden
transmitters, but they won't really go away, will they? I'm no networking
topologist, just curious.

I also see situations where this could make things *worse* instead

of better: two stations with limited range that can hear each other fine but don't need the repeater. It's the old saw of "QSY if you can work direct" but voice users seldom do this (around Boulder, anyway) so why should packet users be any better? In this case, two stations who don't need the repeater wind up using it regardless.

Aside from avoiding the store-and-foreward delay, will such a system be significantly faster? Why not just up the speed, aside from the fact that the world is currently locked into 1200 bps?

I ask these questions because there has been some suggestions locally that duplex repeaters are the way to avoid the hazards of NET/ROM or TheNet or whatever is used at the network level. Also, these have been suggested as a "better" way to utilize the duplex channels than are voice repeaters. I really don't know if that's true or not, but all of the voice pairs are taken on the Front Range. Wouldn't it be smarter to have nodes ingest the slow data and be linked on a different band zipping along at some significantly higher rate, like 56k bps? Or is there something I'm missing here?

I sort of think it's smarter technically and politically to move the packet up in both speed and frequency, but many folks locally feel that the cost would be prohibitive. I wonder... Duplex repeaters aren't cheap, either, and I'm not sure that such an approach would be classed as "advancing the state of the art" or as "bending over backwards to maintain the status quo".

Somebody educate me!

Yes, a "full duplex' (i.e., real-time) repeater will allow stations within its service range to avoid hidden terminal, thus nearly completely avoiding collisions, so you can run maxframe back up to 7. Also, if the carrier can be kept on between transmissions, you can

completely avoid squelch opening delays, so you can cut 'way down on
TXD and speed up the whole channel.

If the repeater is built using a K9NG modem as an FSK regenerator
in the repeat path going from repeater receiver demodulator to its
transmitter modulator, voice won't pass through the repeater without
extreme distortion, so it won't get taken over by the local old farts,
but it will pass BOTH 1200 AFSK and 9600 bps FSK, so it can be shared
between the two groups.

Here in SoCal, I've built one such system, which we hope to have in
mountaintop service sometime soon. We used a 50w Motorola Mitrek with
the power output throttled back a bit, a K9NG, and a TNC at 9600 bps.
People who run 1200 bps only get the repeater, but the 9600 bps users
get both repeater usage AND network node access, thus encouraging more
people to upgrade to 9600 bps.

(If you do this, you do NOT set the network node to full duplex, since
the users aren't full duplex. That way it won't try to ACK their
packets while they're still transmitting.)

My hope would be to place repeaters like this in each community, and
then link them together on some other band using some intelligent
routing scheme. A person would connect to the repeater's node for all
his network services, and with one in each community, few people would
ever be out of range.

I think it's a good way to go.

We use the KA9Q code as a base for our switch code with our 56kb modem,
but it is not limited to TCP/IP. It will happily act as a digi or netnode
for any AX25 frame regardless of any upper layer protocol in use.

>Is some kind of KISS mode TNC needed for this setup, or does the
>PC need a special high speed COM I/O board of some kind?

We furnish a special KISS56 eprom image and modification instructions
for using a TNC as the interface between the 56kb modem and the computer.
However, a special COM I/O board is better. We recommend the Ottawa PI
card and the Gracilis Packet Twin card. A DRSI card will also work, but
will totally flatline a PC while receiving a 56kb packet. Gracilis also
has a very high performance standalone card that will drive three of our
modems simultaneously while acting as a switch. The Kantronics DE56 is
capable of driving two of the modems while acting as a switch.

>There is some interest in my area (mid MO) in building a state wide
>high speed packet network. Most of the folks are thinking 9600 bps
>but I'm wondering why we shouldn't go further and use 56kbps instead.
>
>I'd appreciate any comments about the radio and PC hardware needed for
>56kbps. Perhaps the 450mHz band would be better than the 220mHz band.
>Perhaps some kind of spread spectrum at 900mHz under part-15 at
>100+kbps would be better still!

We run in the 433 Mhz link band here in Georgia as well as having some
links on 222 Mhz. If you are going to use a PC as your switch, you need
an AT class machine with at least a 5Mb hard disk. A couple of DRSI
cards will service your low speed ports, a Packet Twin will drive the
56kb modem and a 9600 baud link, and a standard COM port will handle
the phone modem for remote sysop use. Or you can use external KISS and
KISS56 TNCs and some hacked up 16550 equipped COM ports. You tend to
run out of interrupts quickly. We find that old 5 MB hard disks hold
up better than floppies at our un-airconditioned mountaintop sites.
For 56kb, the modem *is* a radio operating on 29 Mhz. You need a
transverter to bump the signal up to 220 or 440. We use Microwave
Modules MMT432S and Sinclabs transverters. Most any *linear* transverter
will work.

I would appreciate some advice in piecing together a packet station.

I will be getting an old GE EXEC (2M) for the radio.

I have a 10mhz 286. 4mb memory, hard disks, 1 serial, 1 parallel (hopefully to remain comitted to the printer), and mono video.

I have a DOS partition and a Xenix partition (rev 2.3).

I am not interested in being an intermediate node in any network - only a terminal or an endpoint destination. And this for AX.25 (unless IP is better in my area). My friend in Idaho, whom I'll primarily communicate with uses AX.25.

I have several goals:

1) Use simple, inexpensive, TNC if possible.

2) Use outboard TNC if possible.

3) Use PC for processing horsepower.

4) Use XENIX for the operating environment. I use XENIX the most and the packet software could be monitoring the port full time while I did other work.

a) XENIX would mandate code that was written in C or assembler but that used standard i/o functions (although I suppose I could write a device driver). Sources would probably need to be available.

5) Have the PC be a "private node" or "BBS" so that messages were delivered to my PC instead of having to connect as a terminal to read them. I'm not sure

if my terminology is quite correct here.

If I can run the software under XENIX then I can
leave the machine up in the same environment full time
so message delivery won't be a problem.

6) To minimize system loading, it would be nice if the
TNC could be configured to pass only traffic for
me. I would appreciate knowing how this affects the
price class of the TNC.

So, Is this possible? How much of it is? Thanks very much for
your help. I hope to be making a racket with packet soon!

Hi Brett. I assume by your message you have access to a portable
computer. In that case you need only add a radio and a TNC. 2 meter
radios can be obtained used for around $100 and a packet only TNC
such as a PK88 run around $120. If you don't have a portable
computer, any portable with terminal capability should be
suffecient. I've used a Radio Shack model 100 with great success.
All this stuff runs on 12 volts so any car battery will do. A deep
cycle marine battery is better, but not necessary. Let me know how
it turns out. My packet address is N0JCG@WA0CQG.MN.USA.NA

The modems used for 1200 baud packet are similar to a Bell 202 (201?)
not the Bell 212. The 212 is full duplex with the transmit and receive
at different frequencies. The 202 is simplex (one direction at a time)
and uses the same tone frequencies both ways. A TNC usually has the
modem built in but most provide for using another such as PSK.

If you find a 202 (mine was 5 bucks), you should be able to wire it
to the rs-232 connector and run BAYCOM. You need a circuit to key the
TX and possibly a level control for the mic input. The RX audio works
OK and the modem should have 4-wire strapping to separate them. The
rs-232 to modem wiring is strange too and I don't have that handy.

Best bet is to look for a real TNC.

>topologist, just curious.

   Sure, this could be a problem, if there is another duplex repeater on
the same pair not too far away. It could also be a problem if people are
running simplex packet on the repeater input frequency. Either case is
not too likely.

>   I also see situations where this could make things *worse* instead

>but don't need the repeater. It's the old saw of "QSY if you can work
>direct" but voice users seldom do this (around Boulder, anyway) so why
>should packet users be any better? In this case, two stations who don't
>need the repeater wind up using it regardless.

  I refer to this as the "watering hole" syndrome; everybody wants to
be where everybody else is. This can lead to greater congestion on
pair than otherwise might be experienced; however, keep in mind that
the same thing can happen on simplex frequencies, where the degradation
suffered due to congestion would be worse.

  At the same time, the watering hole has advantages... everyone else
is there, afterall. It doesn't make sense for everyone in the coverage
area to run NET/ROM (it offers no advantage in accessing other local
nodes, and one NET/ROM server could link off of the duplex pair). TCPIP
works quite well in a duplex system, and offers so much more functionality
than simple AX.25.

>   Aside from avoiding the store-and-foreward delay, will such a system
>be significantly faster? Why not just up the speed, aside from the fact that
>the world is currently locked into 1200 bps?

By making the topology visible to all participants, the window for collisions (especially due to hidden transmitters) is almost entirely eliminated. This alone provides a sizable advantage when the channel starts to become loaded. A duplex repeater provides advantages at ANY baud rate; in fact, I think it can be shown that the advantages are more pronounced at higher baud rates.

The duplex repeater does not so much speed things up under ideal conditions (it does a little), but it avoids serious performance degradation under average (or poor) conditions. This is more like a quality versus quantity issue.

> I sort of think it's smarter technically and politically to move the
>packet up in both speed and frequency, but many folks locally feel that the
>cost would be prohibitive. I wonder... Duplex repeaters aren't cheap, either,
>and I'm not sure that such an approach would be classed as "advancing the
>state of the art" or as "bending over backwards to maintain the status quo".

Sure, I agree that higher speeds and frequencies have appeal, but they start to cost *everybody* more. A duplex repeater improves the channel utilization enormously for a large number of users without requiring any of the users to invest in new radios, TNCs or computers.

Rather than taking my word for it, read the paper by Scott Avent in the proceedings of the Seventh ARRL Computer Networking Conference (In fact, spend the $50 or so, and buy the volumes for the entire series of the CNCs. They're worth their weight in gold). Figures are presented which indicate that a duplex repeater will provide at least 68% better throughput on a loaded channel than a digipeater. This number is probably indicative of the bottom end of the range (i.e. you may get better mileage). I'd speculate that a poorly connected topology of 2400 baud nodes (with hidden xmitters, etc) probably would not outperform a topology connected well by a duplex repeater.

The 1 June 1991 issue of Jane's Defence Weekly has an article on "lightsats" - lightweight, low-orbit, low-cost, short-lived satellites (pp. 926-7). Included is a brief description of "the only truly operational lightsat system in the world," run by the Soviet Union:

"The most recent generation is known as 'Sextet' in the West and is launched in groups of six on Proton boosters. The currently active constellation of 24 small satellites is referred to by the Soviets as Gonetz (Messenger). Gonetz is believed to be used by the KGB and the GRU for store-and-forward messaging because their low earth orbit periodically places them out of range of receiving stations. It is unclear what, if any, distinction exists between the military and civilian versions of Gonetz.

"Last year, an international consortium was formed to market Gonetz worldwide for civilian digital relay of voice, fax and data from isolated locations to hub stations. Within the USA, marketing services are provided for the Consortium of Small Satellite Constructors and Service Providers (COSSCASP) by New York-based DYJ Technologies..."

Does anyone have more information about this system? Like, how much it costs, and what the phone/address of DYJ Technologies is? What frequencies it uses? Data formats, etc.?

>
I can gateway mail from packet to internet. However, everything coming
from internet to packet must be manually checked for FCC compliance
and I can only deliver internet/usenet mail to addresses that are aliased
to callsigns in my distribution file for internet/usenet mail. The packet
mail headers only allow for amateur call signs as a mail address, so
the bbs mail daemon checks a file of call signs first to determine
if this person (the call signee 8-)) is reachable via internet/usenet
and then mails it to him/her using the unix mailer.

To mail to packet from internet/usenet, mail to "bbs@w2xo.pgh.pa.us" and
make the first line of the message a valid RLI/MBL message command
line followed by a subject line, ie;

SP W7ZZZ@W6ABC<W5QQQ
Burned-out finals
I blew my finals again last night..... etc etc etc
...more text lines
...more text lines
/EX

The last line of the text must be a "/EX", which must begin in
column 1 of the text line. This all you will recognize as standard
packet bbs message form.

Sorry it isn't more elegant, but it's a first hack..

Hayes, and other, telephone modems use Bell 212 tones for 1200 baud. Packet
uses Bell 202 tones. They are *not* the same. That helpful little Z8 in the
modem gets in your way too. Smartmodems are only smart for telephone use.
They try to be stupidly helpful on packet and screw up the works. Forget
about trying to use your phone modem and build or buy a Bell 202 modem.
The standard TAPR circuit using two Exar chips works fine.

We use this technology to back up our Quantel still store systems.
I decided to run some simple tests. We normally do digital dumps
to one inch professional tape machines with signal to noise ratios
of around 50 db. The encoding technique is fairly tolerant of small
"dropouts" due to tape wear, but longer dropouts due to tape damage
confuse the system. This would correspond to short and long noise
bursts respectively on a radio channel. I dubbed the signal back
and forth between one inch and VHS tape multiple times. This degraded
signal to noise and added the equivalent of some multipath distortion
due to the "smearing" of VHS technology. I got a lot of read errors
on the resulting tape. This isn't real over the air testing, but it
looks like the system would work on P5 transmissions if multipath
is minimized.

The protocol used takes advantage of redundancy and FEC, but the
modulation method, encoding as white and black pixels in an AM
TV field, leaves something to be desired. A direct PSK encoding
would be much better. Also the protocol is designed for half-duplex
with large block sizes, again not ideal for two way packet style
transmissions.

Hello:

I am about to resurrect my Xerox 820 packet BBS and am looking for a
recent version of the W0RLI software (or replacement). I have version
11-point-something from about three years ago, but there have been some
changes in mail addressing since then. Is anybody still maintaining
this software? Where can I get a copy?

I am using MBL 5.14 software at the BBS on 4Z4SV.
Can someone fill me in on what the latest version of this program is and
when it was written ?
Also - has anyone ever made a comparative chart on various BBS software ?
i.e. RLI, MBL, AIZ etc. ? I'd be curious to see the pluses and minuses of
each of them.

>with the least overall additional complication.

The system is even better if you operate cross-band full duplex. No duplexers are required so even the home user can run full duplex. Then true collision detection as well as collision avoidance can be practiced. On an active 56kb system this is a real plus. With the long frame times of typical 1200 baud systems, it's even better. Bit regenerators are not much help at 1200 baud in most cases. Since there is typically a one bit time delay through the regenerator, the opportunity for collisions increases. If the signal is strong enough to be decoded at the repeater, the repeated signal is apt to be good enough to decode at the destination as well. The disadvantage of the one bit time delay usually outweighs the small advantage of bit regeneration. Bit regeneration is usually worthwhile at 56kb since a linear transponder would be needed to pass the signal

transparently. The best repeaters use long hang times so keyup delays
at the repeater are minimized. An adaptive level one protocol is needed
to allow the user to take advantage of this. He needs a fairly long Txd
to bring up the quiescent repeater, but then needs a shorter Txd as long
as the machine remains active.

If this occurs, it means you haven't done your job in coordinating LAN/MAN
frequency use. There shouldn't be two LAN/MAN systems that share a common
fringe coverage area on the same frequency pair.

>   I also see situations where this could make things *worse* instead
>of better: two stations with limited range that can hear each other fine

>direct" but voice users seldom do this (around Boulder, anyway) so why
>should packet users be any better? In this case, two stations who don't
>need the repeater wind up using it regardless.

This is simply poor operating practice. One should never use simplex
on a duplex channel, voice or digital. The users should always go
through the repeater, or move to another frequency. As long as they
go through the repeater, the advantage to the network of collision
avoidance remains. If they do move off frequency, then the load on
the system decreases. Either is acceptable practice. Trying to work
simplex on the duplex pair however is *never* good practice.

>   Aside from avoiding the store-and-foreward delay, will such a system
>be significantly faster? Why not just up the speed, aside from the fact that
>the world is currently locked into 1200 bps?

Yes the *system* is significantly faster though individual user pairs may
experience a slightly slower channel. Each individual user pair experiences
a slight slowdown due to the additional keyup delay time of the repeater,
but the overall system experiences a major speedup due to avoidance of
collisions. A collision costs an entire packet frame time while the repeater
delay costs only a few bit times. This advantage is always true regardless
of basic channel baud rate.

>   I ask these questions because there has been some suggestions locally
>that duplex repeaters are the way to avoid the hazards of NET/ROM or TheNet

>significantly higher rate, like 56k bps? Or is there something I'm missing
>here?

There is a major difference between user LAN/MANs and backbone trunks.
Duplex operation is almost always a major win for LAN/MAN operations.
Proper point to point links and non-contending frequencies are the best
methods of managing backbones. Full duplex gives thruput advantages to
a backbone channel since data can be flowing in both directions between
switches simultaneously, but properly designed backbones never have problems
with collisions because frequencies are coordinated so that no more than
one pair of backbone sites can hear each other on the same frequency.
The scheme we use is:

LAN-146mhz-switch-430mhz-switch-222mhz-switch-430mhz-switch-145mhz-LAN

>   I sort of think it's smarter technically and politically to move the

>and I'm not sure that such an approach would be classed as "advancing the
>state of the art" or as "bending over backwards to maintain the status quo".
>
>   Somebody educate me!

Moving a large user population up in speed and frequency *is* expensive.
Moving backbones up in speed and frequency is a good idea. Using *one*
expensive repeater to service *many* user stations is a good idea since
the costs can be shared and work out to much less than the cost of upgrading
each and every user individually. In packet, you always have to think in
terms of total system thruput and total system cost rather than individual
thruput and individual cost.

56 kb is a natural for backbones and, as your users put more sophisticated
demands on the network, it becomes very attractive for users as well.
However, for the casual BBS user, or keyboard chatter, 1200 baud is often
sufficient, and if more performance is needed, 9600 baud is often a cheap
upgrade path. 56kb systems are often cheaper than 1200 baud systems if
they must be purchased from scratch, but 1200 and 9600 baud systems can
take advantage of radios already owned by the user and cost him a smaller
incremental cost. A cost breakdown that I have done shows 56kb to cost
around $550 while a ground up 1200 baud system costs around $650. But
the existing radio of the 1200 baud user can bring his incremental cost
down to $120. Going to 9600 baud only adds $99 to his incremental cost.

My email had four recommendations for Kantronics and two for the PK-88.
Kantronics also had one day seminar on packet here this weekend. Mike
is a very impressive fellow. Anyone interested in packet would want to
take in the show even if you had no interest in purchasing anything.

Anyway, my order for a KAM is in process. Thanks to all who responded
on email.

After looking over the documentation on my new TNC and reading thru "Your
Gateway to Packet Radio by WA1LOU(?)", I find that 20 bytes of overhead per
packet is going to kill my thruput, especially considering I want to send
one 8-byte packet every 25 milliseconds at 9600 baud (full-duplex). It
almost sounds like KISS mode might eliminate some of the overhead, but I
don't have a very good handle on how it works, does it:

1) Send a 'normal' packet, with the usual 14(+) byte adress field,
and all the rest of the stuff that makes up the 20 byte overhead,regardless
of the fact that it's not connected.

or

2) Just send some kind of special packet, with less overhead.

Any ideas? Where can I find the protocol spec for talking to a TNC in KISS mode? Many thanks in advance! [BTW: It's a real-time application, and I can't just send one 256-byte packet every 800 ms.]

There is currently much discussion and publicity about Wireless LANs, their possible applications, choice of frequency, protocols, etc. The I.E.E.E 802 committee has established a sub-committee (802.11) to propose a standard for Wireless LANs.

Wireless LANs pose a unique challenge to the engineer since they represent a combination of technologies:

- RF design
- Propagation and wave physics
- Data communications
- Computer engineering
...

Few engineers or designers have all these skills in their portfolio; progress towards Wireless LANs therefore requires teamwork and an open mind to allow experts in different technologies to contribute and work towards a common goal.

We propose to establish a moderated mailing list to provide a technical forum for the development of Wireless LANs specifically aimed at data communications rather than voice. Our goal in moderating the mailing list is to avoid the degeneration of the list into a forum for answering users questions such as "Which Wireless LAN should I choose ?" or "I have this problem, please help !".

Our hope is that the mailing list will provide a forum for the engineering and design issues associated with all aspects of wireless LANs.

Assuming that the traffic on the mailing list got to a reasonable level we also propose to gateway the mailing list into a moderated USENET News group.

If you are interested in contributing towards the technical development of Wireless LANs and support this proposal for a forum, please e-mail to

listserv@tandem.com

To subscribe to the mailing list, send a mail message to the above address with the following command in the body of the message at the beginning of the line.

add jblow@sum.domain.org wireless

Help may be obtained from the list server by including the word HELP at the beginning of the line in an e-mail message.

KISS is a protocol for transporting data or commands between a computer
and a TNC. The TNC will take anything that is inside a KISS data packet
and append a 16 bit checksum to it and send it to the transceiver.

If you want to reduce the overhead imposed by AX.25 you could either 1)
use higher bit rates, such as 56 kbps or 2) devise your own link level
protocol. What is transported inside a KISS data packet does not
necessarily need to be an AX.25 frame, it could be anything you have
designed that you feel is better. (Legalities not considered.)

Don't forget that most unmodified transmitters have a fairly long key-up
delay, at least 200 ms. At 9600 bit/s that equals to an overhead of 240
bytes.

There was a suggested plan published in QST that looks much better to me
for national purposes. Local and regional needs, of course, still make
it necessary to make adjustments for their purpose. I just wish that the
process for a national plan had moved faster so that those making the
decisions on local variations would have some insight into the potential
impact with regard to nearby and mobile operations.

There is still a severe problem in the communication of local and regional
bandplans to those that genuinely want to know what they are.

There is a chance I might be in SoCal next month, and if I cannot get a
copy of the local bandplan by the time I get their, I will be operating
under the ARRL national plan, with the usual avoidance of interference
when that becomes known, until such time as the local plan is made
available.

>repeater pairs can be used for digital operation, but I think this plan is

>This obviously won't happen in densely-populated areas which are already
>chock-a-block with analog FM repeaters and links, but I firmly believe
>that they should not set the pattern for everywhere else.

One might say that in SoCal, there is more FM repeater usage than there
is packet usage. Possibly it is more a case of the status quo not being
able to move along with the needs of the future, such as has giving packet
a share equal to the FM share when the level of packet usage comes up that
high.

However, the most likely explanation might very well be that in SoCal,
there having been so much band crowding already, that those interested

in doing new and innovative things like high speed packet, have already moved up to higher frequencies (23cm, 13cm, 9cm, 5cm, 3cm, etc.) in the first place. Many are involved in even higher speeds that a 100 kHz channel could not even handle (such as 10 megabaud on 10 GHz as I have heard about). Basically, probably quite a number of hams in SoCal have simply written off the 2 meter band.

>Then again, there's talk of us losing the *whole* band in Canada, so this
>may all become a moot point. A look at a recent repeater directory will
>show how sparse 220 use is up here... we need to get more wideband digital
>going on this band, and soon.

The problem is you get your 220 radios from the same dried up source as we get ours, on the other side of the Pacific. What is the ratio of 2m radios to 220 radios you find on the USED market, even if you DON'T count the ones originally marketed new for commercial uses.

I scrounged the flea market at the Dayton Hamvention for Icom 220 MHz HT's and found ONE which was an IC-03AT. I would have bought an IC-3AT had I found one. There was a Yaesu one as well. There were dozens and dozens of used Icom, Kenwood, and Yaesu 2m HT's for sale in the flea market. It sure seems that people are hanging on to their 220 MHz radios.

I am preparing a spec on BBS-to-BBS authentication using DES. What I seem to be missing is how a string of characters is translated into the 56 bit key. What is an accepted way of doing this?

I hope to have the spec ready next week and will post it here for you guys to take a shot at. It should include LZH compression and binary message transfer too.

First, I believe Hank no longer will release source code. The last
C code for W0RLI might be gotten from VE3GYQ, Dave Toth, who was
the last person to work on it and that was way back at version 6.

Several years ago I ported W0RLI to Sys V Unix. It isn't a wonderful
thing because , being a PC program, it is a big loop and uses CPU
cycles even when not running, but I may be able to scare up the
source. I believe others have done this also. The version I ported
was 2.something, which is pretty old now, but the I/O is the main
thing and it will probably work with newer code. You are welcome
to it if I can find it.

A better solution is to run KA9Q 'net' using KISS tncs which gives
you AX25, Net/Rom, TcpIp and I have bbs code to run with it for
Unix Sys V and Berkely).

I have what (I hope) is a pretty simple request. What I basically
want to do is to recieve weather sattelite images onto an IBM-PC type
machine. Although I have a pretty fair EE background I don't have much
experience with amateur radio. Basically what I want is the cheapest
hardware solution that will get the job done. I have access to a
(recieve only) SW radio that I can use as a reciever. Do I have to buy
a packet controller? (Someone recommended a 'packrat' which runs about
$300 and hooks up the serial port. Although I think this will get the
job done it seems like overkill as this box appears to be able to both
transmit and recieve a number of digital formats including Weather maps)

I guess my basica problem Is I don't know where to go from here. I am willing
(actually prefer) to write my own software, I am just not aware what the
minimum hardware requirements are and how to get started. Can anyone point
me in the right direciton? Any publications/books which might help?

Thanks

John

>variants of of TCPIP that are around that confuse me even more.
>My questions are:
>1. Is there documentation for this version and is this version any different
>   to the others around.

The "base" documentation is in /pub/ka9q/docs/ka9qnos.* (there are three
versions, nroff, postscript and plain text). Although it needs a little
updating, it is fairly accurate for the 0423 version; the main differences
are a few new features (like the "encap" interface) that I haven't documented
up yet. If you don't use the new features, then you won't have any problem...

>2. If this version has no documentation, what version is recommended for use;
>   especially if on wants to turn the MBOX on and have some BBS activity on AX25

There's a mailbox in my "base" code (the stuff in /pub/ka9q/nos).

>3. How do I turn the MBOX ON in this version of the NET and how do I get it
>   to send a banner to a connecting station (on AX25) just like the beginners
>   guide says.

If you mean "why doesn't it say anything right after I connect", this is
a deliberate feature. AX.25 doesn't specify the upper-layer protocol to
be used during the connect establishment, so there's no way to know if you
really want the mailbox, or if you just want to pass IP or NET/ROM datagrams.
By waiting until the user enters an empty line, you can tell for sure that
he wants the mailbox.

BTW, SM0RGV is the author of the mailbox code. I don't support it directly.

>4. What about the versions hacked by PA0GRI and G1EMM? Are these the versions
>   that include all the bells and whistles and hence the ones to uses. I'd like
>   to know the differences.
>

The PA0GRI and G1EMM versions are also on thumper in /pub/ka9q/pa0gri and
/pub/ka9q/g1emm. Please note that I don't support these; I simply provide
space for their redistribution.

Tom,

Many thanks for the suggestion. With some minor variations I'm making
this change to the code right now. After initial testing I will upload
the new version to thumper.bellcore.com in /pub/ka9q/nos. Hopefully
this will fix the problem.

I hate making absolute references to data variables like this, but the
brain-damaged BIOS time function leaves me with no choice. The Turbo-C
biostime() function I had been using simply called the BIOS INT 1A
AH=0 function directly, ignoring the midnight rollover flag. I guess
they figured no sane user would be calling it so frequently that he
would be likely to be the first caller after midnight (before DOS gets
a chance to update the date).

I'm looking for any information on a glass mounted antenna that
would cover 440MHz and the 880MHz (cellular) bands.

I figure that a 1/4 wave 440MHz whip may load on 880MHz with a bit of
help, (i.e. matching network) but one of my friends tells me "no way".
(Or how about a 1/2 wave 440 whip?)

I don't want to stick more than one antenna on the car, drilling a
hole is out of the question (would you on a Porsche?) and mag mounts are
a pain in the neck.

Does anyone know of such an antenna? Or how I could maybe MAKE one
(load) on both bands?
I have some data on making single band antennas from a neat article in
the April/91 issue of QST p.31 by Bill English, N6TIW, but I'm hoping
someone out there will help me out on my quest!!!

If you can, please respond direct to me and I'll summarize and post if
there is interest....Thanks...73s

Hi, thanks for reading this and hope you can help..

I read an article (rather dated tho) in CQ a while back which said
an organistaion called GRAPES had produced a kit for a 56K modem for
use with a tranverter onto 70cms.

Being just about to graduate later in july and having some spare time
I would like to try and build one for experimentation purposes in the
EDINBURGH area over the summer vac.

Can anyone give me address/details/prices or any more info about higher
speed packet systems I`m getting bored with TCPIP on 1200 around here...

Thanks

For me, the main thing is the backbone connectivity. What I want to do is
to make the thing run under XENIX/UNIX, taking advantage of the streams
capability of most TNCs. That way, I can support 10 different users on
the BBS at one time.

>A better solution is to run KA9Q 'net' using KISS tncs which gives

Well, maybe, but how many folks out there are running net as opposed to W0RLI?

Unfortunately for the Packratt PK-232, weather pix aren't transmitted
in digital format. The PK-232 modem is only a binary slicer and will
give you a grey scale consisting of black and white. This is fine for
maps, but is sorely lacking for satellite images. It does have the
advantage of already having firmware on board to put the map in a
format that their software can display on the PC. It's also good for
RTTY and Packet work. It also may have been upgraded since I got mine.
MFJ has a box called the 1278 that does packet, RTTY, and supposedly
greyscale weather fax. I haven't used one.

>I guess my basica problem Is I don't know where to go from here. I am willing

The Weather Satellite Handbook (ARRL) is your best choice. The grey
scale is encoded using tone encoding with something like 1200 hz to
1800 hz being used to encode from sync to peak white. Using a simple
zero crossing detector kicking a spare LPT interrupt and a little assembly
coding on the PC, you should be able to decode the tone pitches to greyscale
values. More elaborate schemes would probably work better on noisey signals.

Halp! I just bought 4 NIFTY gadgets (at a surplus auction), and I'm trying
to get them working with no documentation whatever.

The unit in question is a "wireless modem" which puts out a solid 1/2 W (VHF)
and has high quality, separately tuned (with dip switches), PLL-synthesized
transmitter and receiver sections. It has an rs-232 port and an antena jack

in the back, and tx/rx leds in the front.

To be more specific, the unit is an "ESTeem wireless modem, model 84" by
Electronic Systems Technology (no address or phone numbers appear anywhere
on product). I don't think they made too many of these ... one of the ones
I have is serial number 40!

If anybody has any suggestions regarding:
     how to locate the manufacturer
     how to reverse-engineer this thing enough to figure it out
please email. If you post a response, please only post where appropriate.
This article is crossposted.

Please, no flames from hams about it probably being illegal to put these
thingies on the air. I'm only interested in the technical exercise of
getting them working with dummy loads. I'm a licensed ham operator and I
know the laws. Flame-retardant off. :-)

                              little david

Don't know if the other message/article was posted here, so I'll request again. Does anyone know if a PACKET (either AX.25 and/or TCP/IP) gatewaye exists between PACKET radio and Internet? If so, could someone please state where it is located? If not, why has this not been performed? Additionally, what would be needed in getting set up?

Robert S. Radvanovsky, KC6ONL

Does anyone know of software for a PC which makes a CUA type interface for packet radio? That is an interface like IBM's Common User Access (CUA). This can be a Windows 3 interface or Presentation Manager or something which looks like them (with or without graphics and mice).

>--
The two are apples and oranges. 'Net' is just the networking
software. W0RLI is a bbs that runs under MS-DOS. What you
do is run an RLI-compatable bbs talking to 'net' through
some IPC channel. This allows you do do some neat stuff like
use the unix file structure and utilities to support the bbs.
For instance, bbs mail can be handled by a separate process
which is akin to 'Sendmail'. This is extremely powerful and
allows you to handle bbs<-->smtp mail, bbs<-->internet mail and
whatever your imagination dreams up. Number of users is
basically unlimited, as you spawn a new bbs with each user, each
talking to 'net' thru an IPC channel. (I use SYS V message queues, but
you could use streams, which is more modern). Each bbs will block
when there is no input or output and use far fewer cycles.

The C version of W0RLI (called CBBS) is available from TAPR on either 5.25"
or 3.5" floppy. The disk contains executable AND all sources. I used it to
port the code to the AMIGA. Current version is V6.71.

One note from that Golden Gate bridge: please be clear what you mean by a gateway
-- I assume from the description you're talking about a *mail* and/or News

gateway; there are more functions possible if one can (selectively) route at the IP layer.

Cheers,
  Willis Marti

We are all famous for 15 minutes, so here is your chance I guess :-). I have been running an (ASCII to TNC, UNIX V7) Packet Radio<--->USENET gateway (mail and news). Anyways, many of the articles that I receive here in rec.radio groups are passed on to the local MSYS BBS. To help much of the manual effort, I ended up maintaining an ever expanding list of Amateurs that post to Usenet. This list is used to place the call of the poster at the beginning of the subject line as the articles are posted to the packet board. This list is by NO MEANS complete. Enjoy (I hope).

Ciao, 73 de VE6MGS/Mark -sk-

First the hardware : PC/XT , 20+40 Mb hard disks 360 floppy,
 OH-TNC (a tnc clone) with kiss mode on, Kenwood TR 2400
Software : MSDOS 3.30a, NOS version 910423 (quite new).

My problem : I've been trying to set up ax25 connection for
out local FBB mailbox, so I could send messages to outside world.
Telnetting to localhost (telnet oh3lku.ampr) gets me to my mailbox,
giving command "SP oh3mvv@OH3RBR" prints line "To: ", but texts in
SMTP trace printout is correct (Rcpt: <oh3mvv@oh3rbr>) : However
the smtp trace says that recipient needed after the first data line.
Has anybody succeeded doing what I want or am I the only one ? Note
that no forwarding is yet going on and no aliasing is made for oh3mvv.

I'd like to receive help for configuring mail connection for
AX25 mailboxes, any points will be considered, also example files.

BTW : mail for tcpip connections works

Does anyone know if there is any machine on the network where I
can obtain the W0RLI BBS Program (Not the source code, just the
executable), via anonymous FTP?
The local packet bbs sysop is getting his copy via modem and long
distance phone call. I promised him that I would check to see
if it's available on the net via ftp. Again....I don't need the
source...just the binary executables.
Which machine would have the latest releases?

Thanks

I would like to setup a mailing list of hams who run an Internet-packet
mail gateway. The purpose of the mailing list would be to share ideas and
concerns about running such gateways. I figure such discussions might be
inappropriate for tcp-group and would get lost in the noise in
rec.radio.amateur.packet. The information shared in such a mailing list would
be a little more 'secure' and low-profile than if it were blurted out in
tcp-group or rec.radio.amateur.*.

If you run such a system, please let me know and I will place you on the list
if you're interested.

Tony

```

Over the past few months on our local Packet LANs here in Adelaide
I have noticed an increasing amount of congestion as a result of
very badly set TNC timing parameters. Some people appear do have
things like Dwait set to zero! I would like to put together
a set of suggested parameters to put in the local packet news
letter here and wonder if people could offer some suggestions as
to what the various TNC parameters should be set to.

The LANs here typically consist of 1 BBS with multiconnect/multiuser
capabilities (4 users plus a forwarding BBS conenct), several
digipeaters and about 10-20 people on simultaneously either being
connected to the BBS (often via one of the digipeters) or having

conversations/file transfers via several of the digipeaters or
using the fairly large number of PMS's that are on the channel
(of which there are about 10 on 24 Hours a day).

Any suggestions on what typical TNC parameters should be used would
be most useful.

The users here have typically either the older style TNC-2's with the
dwait parameters and increasingly there are TNC's like the
MFJ and KAMs which have the slottime/persist parameters. What
would be the optimum parameters for the BBS and the Digipeaters
and also for the users to use?

Also I would be interested in a detailed description of how the
slottime/persist parameters work.

Please send replies via E-Mail to my address below. If there are
sufficient replies I will sumarise and post the results in a couple
of weeks.

Thanks in Advance... Grant VK5ZWI

This is the reason that direct gateways between Internet and Amateur Radio
are illegal!

Of course, even a relatively simple program would probably catch the blatant
language used here.

Well - I now have the KA9Q Net software (which, BTW is better than a
lot of COMMERCIAL software I've seen) running on my SCO Unix Box, and
I can use it in AX.25 mode to talk to my local (SEAW) AX.25 PBBS.

I have two questions:

1) What do I do next? I have any IP address, but I have no idea where
there are any other IP hosts and how I might connect to them. I'd like
to test ftp, and work on getting SMTP (which should be a real trick,
as those of you who have worked with MMDF can appreciate) working.

2) The version of net I have seems pretty old (a lot of the commands
documented in the stuff I have don't work, like tip). It
announces itself as version 890421.1a (n3cvl unix test). Is there a
later version somewhere (I got this one from WB3FFV? I'd need
either an anonymous uucp site or a packet FTP (assuming I get ftp
working ;-)) site.

73!

If no one near you is interested in tcp/ip, you can set up
'net' to use the net/rom 'network' to pass your IP packets
to someone accessable via net/rom. There are no full-time
tcp/ip stations here in the Pittsburgh area, but I have
good luck with SMTP to central PA and down to WVA.

With the back-off algorithmn that the KA9Q stuff uses, it
is very tenacious and will 'get the mail through' if there
is any kind of path at all, so it is usable over moderately
long distances on the 'network'.

>2) The version of net I have seems pretty old (a lot of the commands
>documented in the stuff I have don't work, like tip). It
>announces itself as version 890421.1a (n3cvl unix test). Is there a
>later version somewhere (I got this one from WB3FFV? I'd need
>either an anonymous uucp site or a packet FTP (assuming I get ftp
>working ;-)) site.

This is the 'official' Unix version of Net. Bob , N3CVL, is the
person who is coordinating the Unix end of things for the project.
Anders (SM0...whoops forgot his call!) has done some work with
NOS for unix. He is here in Pittsburgh at CMU doing some kind
of sabbatical or something.

I would suggest e-mail to Bob, N3CVL (hoffman@cs.pitt.edu).

I live in Austin, and am using N5PSW as my 'full-service' PBBS.
What do you reckon my address is? something like: N5TLZ@N5PSW.TX.USA.NA ?
Are there any non-standard pound sign thingys (#) that I might put in there
to make routing easier? e.g. for Central Texas?
If you are fairly sure of the proper address, would you drop me a note
on packet? Thanks!

Hello Jim,

NET/Mac has run fine on SYSTEM 7.0 ever since the first Alpha-release...

I suggest you migrate to SYSTEM 7.0 as soon as possible, and I'm sure
you'll encounter A LOT of very pleasant surprises there. Just DO IT!

Subject: Effects of multi-path propagation

There have been several recent papers (I can dig out the references if anyones interested) both as submissions to the IEEE 802.11 committee and the IEEE Trans. Comm on the amount of jitter caused by multi-path distortion. Some of the work has been done by the cellular folks, the rest by those working on Wireless LANs.

Although the cellular folks were working over terrestial paths of a few kilometers and the WLAN folks over a few tens of meters, the results are remarkably similar. Multi-path distortion results in jitter between 100 and 200 nS.

A good analysis of the effects of muli-path propagation on jitter can be found in IEEE 802.11/91-3 (Radio System multipath propagation analysis leading to possibilities for mitigation - Chandos Rypinski).

To cut a long story short, multipath propagation results in two distinct problems - fading and intersymbol distortion. Some of the effects can be overcome by diversity reception (using two or more antennas) but there seems to be a fundamental issue. Given 100-200 nS of jitter it would seem to suggest that Wireless LANs are restricted in bandwidth to something between 256 Kbps and 1 Mbps (assuming a jitter to data period ratio of 10:1 or similar).

The simplest way to reduce the effects of multi-path propagation is to use optical (line of sight) paths with narrow beamwidth antennas. I suspect this is partly how Motorola gets its claimed bandwidth (being at 18 GHz probably helps too :-) !

There are several products on the market that claim higher bandwidths than my postulated 256 K - 1 Mbps range. It would be interesting to see the results of some field trials and the types of BER that result.

Does anyone have any results they would share or any comments (rebuttals are fine too !) on the limitations on bandwidth resulting from multi-path ?

Stuart

BTW, the WIRELESS mailing list is now some 80 folks strong as of today !

Subject: Re: Effects of multi-path propagation

What is the characterization of the 100-200 nS jitter? When I use the term jitter (I usually work in internetworking) I mean it as something like "the uncertainty in how long it will take a packet to reach its destination." That is, it may take 100 mS with a 20 mS jitter (whether this means 80/120 or 90/110 as the limits is another issue) to get through.

But in radio, I think the term might mean something else....

Anyway, intuitively it seems like in a given setup without fast-moving reflectors and RFI sources and all, that the signal will settle down to a particular standing-wave interference pattern and what you get is what you get. I don't see how, say, a 4 MHz sine-wave (or 4 GHz for that matter) would arrive as anything other than a 4 MHz something-wave made up of all the different phase/attenuation values from the multiple paths. That is, I can't see my bit-stream getting overlaid with itself differently at different times, so once I get a signal that works, it works for a long (i.e. many bit-times) time. I can see how having the bit time be less than the difference between the signal propagation times for the major signal paths would make things unhappy -- but I would guesstimate that with 100-200nS difference (which sure as heck can't happen if the signal only goes 30-50 feet!) you could push it to 5 MHz without too much fuss.

But then again, I'm no radio engineer....

>

Well now.... think of the time it takes a bit to propagate from transmitter to receiver; in actuality not much different from Ethernet. Signals (RF or otherwise) propagate at the speed of light (300 E6 m/s) in free space or at about 0.6 C (C= speed of light in a vacuum aka free space) on a cable (this modification ratio is called the velocity factor of the cable and is quoted by the manufacturer). Since we're talking wireless here, consider the physical length of a bit - at 10 Mbps, one bit period is 30 meters long (think of it as a wave train). Another way to think of it is that the bit takes 100 nS to travel 30 meters.

Now think about the effects of multi-pathing; since we're dealing with RF from an antenna there will be several paths traversed by the wave train - the direct (sometimes called optical) path and reflections caused by the floor, ceiling, furniture, people ..... Rypinski's paper says that a path difference of 0.1 times the bit length (or 3 meters) begins to cause fading while more causes inter-symbol distortion.

Think of the wave train over the optical path; the bit takes 100 nS to propagate from start to finish. A reflected component of the wave train shows up some delta time later (delayed by travelling a greater distance) and finishes correspondingly later. The late arrival causes the relected component to "smear" into the next bit period. If the time delay is greater than 0.1 times the bit period it begins to corrupt the next bit or symbols worth of data. The effect is similar to phase induced jitter since it creates an area of uncertainty at the beginning of the bit.

Such jitter can occur over short paths (< 10 meters) and so creates problems running at high speeds (back to my assertion of jitter not exceeding 1/10 the bit period).

Sorry for the long reply but this is an example of the problems facing the marriage of data comm and rf technology that gave rise to this list (BTW now over 120 strong !).

Stu

From: Aaron Leonard <LEONARD@Arizona.edu>
Subject: NCR's spread-spectrum FCC request to be denied?

Stu:: We do however have a distinct shortage of
Stu:: contributions.

Well, this new addition to the Wireless mailing list won't
let his late arrival nor his lack of RF sophistication
prevent him from contributing ... so here goes ...

We've been looking at the NCR spread-spectrum PC transceiver
cards as a potentially handy way to do some metro-area
networking on the cheap. (Our interest would be particularly
in using them in unidirectional mode ... getting a couple of
yagi antennas, finding a line of sight, and then use
PC-Bridge to extend our LANs via the spread-spectrum.)

The pluses would be cheap (around $5K for all the hardware),
quick to set up (supposedly no FCC approval a la microwave),

fast (200Kbps??), and good distance (up to 5 miles?)

However, I just heard a rumor that the FCC is "on the verge"
of denying NCR's petition to use that range of spectrum for
its spread-spectrum application. Supposedly the transceivers
were only being allowed to operate in "experimental" mode,
and supposedly the FCC is going to pull the plug on the
experiment within the next couple of weeks.

1) Can anyone who knows more than I do (that is, anyone who
knows anything at all) report on the FCC status of NCR's
spread-spectrum products?

2) If the spread-spectrum stuff looks like a go FCC-wise,
would anyone care to remark on the suitability of the NCR (or
other) spread-spectrum transceivers for bridged or routed
Ethernet?

Thanks,

Aaron

Subject: GUNNplexers for LAN use?
To: wireless@tandem.com

I just received a question from one of our student employees about the use
of GUNNplexers (10.2GHz typically-HAM-Radio-only device) for extending an
ethernet between two buildings that don't have fiber yet.

Any experience with these beasts?

I read articles about these devices in "QST" and "Ham Radio" more than 5
years ago. Seems that they would be great for short-distance (less than
500 meters) line-of-sight wide-bandwith (more than the usual audio 4KHz)
applications. Just brew up an IF strip that has 20MHz bw and provide the
appropriate signaling on an FM detector so that collision detect wasn't
a problem, and away you go!

As I recall, they are quite temperature sensitive, but that can be overcome
with a styrofoam 6-pack cooler and a lightbulb/dimmer circuit.

Any suggestions are (probably) appreciated.

From: Ron Gershon <gershon@vis.toronto.edu>
Subject: A question about this newsgroup
Date: Thu, 30 May 1991 09:43:04 -0400

Hi.

Just wondering if this newsgroup applies to powerline communications as well. We, at Adaptive Networks, have developed yet another wireless communication solution using the AC powerline, and offer LANs using this module. Therefore I would be interested to know whether the membership of this newsgroup is interested in this medium.

Thanks.

Ron Gershon
Adaptive Networks Ltd.

From: Ron Gershon <gershon@vis.toronto.edu>
Subject: Info on Adaptive Networks' powerline communication products
Date: Thu, 30 May 1991 12:07:32 -0400

I didn't know my message will be posted directly to the list, nor did
I anticipate a lot of responses, so let me summarize what Adaptive
Networks has to offer.

Ron.

Adaptive Networks' patented AN192 technology transmits data at an
effective throughput of 19.2 Kbps over powerlines with the reliability of
dedicated communications wiring. Designed into OEM products, it allows
them to network over existing powerlines, thus eliminating the cost and
hassle of installing wiring. An ISO standard for shipboard monitoring of
refrigerated cargo containers was awarded to Adaptive Networks in January
of this year over competing proposals from Westinghouse and NEC/Mitsubishi.

We provide board-level products, as well as self-contained standalones units.
In the 4th quarter of this year we will have a 2-chip set version of the
product.

Some of the current applications of the AN192:
* School security system (time and attendance) in New York City
* Shipboard monitoring of refrigerated containers
* Materials handling through moving stacking cranes for storage
and retrieval in an automated warehouse

Prices vary with quantities. For the 3" x 5" module (board), prices vary
from $650 per module for a quantity of 2, to $122 for quantities over 1000.
The standalone product is slightly more expensive. The 2-chip set is expected
to be in the double digit price range.

Product specifications:

Network Configurations:
* Token Bus
* Master/Slave centrally controlled bus

Powerline Interface:
AN Isolation module protects against
powerline surges and spikes

Network Size:
Up to 65534 nodes

User-effective throughput:
19.2 kbps

Bit Error Rate:
< 1 x 10^-9

Size (of module):
3.05" x 5.20" x 0.45"

Power Requirements:
Voltage: +5 VDC and +/- 12 to +/- 15 VDC
Consumption: 5 Watts typical

How much noise does your network generate on the power lines? We already have several problems with noisy power here, from a braindead digital clock that runs at about 8 times realtime to random computer crashes. The experts claim that this is all caused by excessive noise on the power lines. Expensive power filters have solved the problem on our critical machines, but we aren't rich enough to put filters on all our electrical appliances.

I'm quite skeptical about AC powerline networks (and control systems like BSR) because of the problems caused by power line noise. Here's your chance to change my mind... :-)

Sounds like complete baloney to me, unless you are talking about some
NCR product other than the WaveLAN.

The WaveLAN's have a sticker that says "FCC ID: IMR915RLAN-1."
They operate at 2 Mbit/s on the 900 MHz band.
I have a BSD UNIX style driver for them that I run on Mach 2.5. FTP
gives a throughput of 120 kbyte/s at best. Just shipping UDP packets
gives a throughput of 130-150 kbyte/s on average.
Performance worsens if one tries to run more than two WaveLANs at the
same time, as might be expected.

I can make the driver source code available to anyone who has a MACH
source license. And I would be interested in knowing whether someone has
written an MSDOS packet driver for the WaveLAN.

Subject: NCR Unveils WaveLan Network
Date: Mon, 20 May 91 09:55:09 -0400 (EDT)

  ATLANTA -DJ- NCR Corp. said it unveiled a micro channel version of
WaveLan high-speed wireless local area network.

  The company said in a press release that the network eliminates the
need for wiring to connect personal computers in office settings.

  The company said that its WaveLan can be used with the vast majority
of network operating systems currently being shipped.

  NCR WaveLan has a suggested retail price of $1,390 for the Network
Interface Card including Novell NetWare v3, NetWare v2 and Microsoft
Lan Manager drivers as well as the omnidirectional antenna.

Subject: Re: GUNNplexers for LAN use ?

I've been thinking about this very thing myself. One should note

that amateur regulations on content are very restrictive, but
it seems like a device operating under the new FCC Part 15
intentional radiator rules on 24 GHz should work pretty well.
24 GHz is more affected by atmospheric water vapor and the power
limitation is 250 microvolts/meter measured at 3 meters, but it
seems that a short hop wouldn't be too difficult. The trick is
to build a receiver that can run at 10 MBps, of course, so the
microwave tranceiver can be used with standard ethernet hardware
instead of some sort of custom modem card or even T1, which are more
expensive.
Low power (1-2 mW) 24 GHz gunn tranceivers can be had for about $70 new
and modulation is trivial, especially on those tranceivers with varactor
diode modulators, so if the cost of the IF/demod hardware could be
kept low, this might be one of the cheapest wireless network solutions
available

I suspect that MOST of these problems may be related to equipment-generated
harmonic currents. There was a recent bulletin to sites with multiple IBM
3090 mainframes relating to harmonics generated by these machines with their

MG sets causing MAJOR problems for UPS's. We have seen this cuasing problems with PC's and the like.

Our technology employs advanced spread-spectrum techniques, incorporating
an adaptive/wideband approach and noise-immune networking protocols

specifically developed for handling worst-case powerline noise and attenuation. We use the 150-400 kHz bands for our purposes, and our transmission would seem like white noise to other systems. We put no more than 1 Watt of power on the line. Consequently, none of the users of the AN192s has ever complained of computers crashing as a result of the AN192 transmitting in their sites.

As for BSR and other systems, they do not offer bit error rates < 10^-9 as we do, and we have systems in the field to prove it. In fact, we are currently developing a version which will be incorporated in a new commercial automated electric utility meter reading network. This will definitely allow for the use of the powerline as a communication medium, while recording how much electricity is being used by all your electrical appliances...

From: zawada@ncsa.uiuc.edu (Paul Zawada)
Subject: Re: Motorola Altair System

Well, we don't have the Altair system installed, but I had a Motorola salesman here to demonstrate it. I was skeptical that it was going to work well, but I was really impressed! It did everything they said it would. It was pretty transparent, like the wire was there. It worked through doors and down hallways very well. (We did manage to push it to the limit by trying to bounce the signal around two corners, but you can only ask for so much...)

First of all, the Altair system is not protocol dependent. Altair merely forwards ethernet frames. All it looks at is the ethernet addresses of the hosts involved. So if you have ethernet, Altair should work. i.e. Altair dosen't care if you're running TCP/IP, Appletalk, OSI, etc.

One nice thing about the system is that the control module keeps track of the ethernet addresses connected to each user module. This allows it to pass only necessary traffic accross the radio link. i.e. it works almost like a smart bridge. Traffic between hosts on the user module does not get sent to the rest of the network. Similarly ALL traffic on the control module's ethernet does not get passed to the user modules. Each user module gets the traffic for the hosts attached to it.

As for system management, currently there is an RS232 port on the control module. Don't ask me what functions are available, since I did not get a chance to play with that part of the system. The salesman said that SNMP was currently in the works. I really don't know how much of an issue this is, since the Altair system is pretty transparent. It would be nice to have SNMP, but since the devices are pretty much passive there isn't much you need to monitor other than if the link is up or down. (The user module has a green LED that blinks when it is searching for its control module and glows steadily when the link is up. So you can

tell if the connection is there or not, you just can't do it via the network.) Is there such a thing like SNMP for ethernet cable?

Remember, I only had this thing demonstrated for me. I don't have one installed. (yet) If it always works as well as it did for me those two hours, I would be more than satisfied! Hope this gives you some more info on the Altair system.

From: "Pete Lucas, NCS-TLC, Holbrook House, Swindon" <PJML@ibma.nerc-wallingford.ac.uk>
Subject: Power-line LANs.

Much of the problem noise that affects these systems infact comes from switched-mode powersupplies (as used in almost every PC!).
These rectify the AC line current, and due to the short conduction-time of the rectifiers, often result in a significant 3rd-harmonic current flowing down the supply mains.
Also, being in effect a power-oscillator, harmonics etc. of the switching waveform get superimposed on the AC line.
In an environment where many switching powersupplies are used, the 3rd harmonic current can approach (or exceed!) the total current drawn at the fundamental frequency; particularly in 3-phase systems the current in the nominally 'unused' neutral line can be greater than the sums of the currents on the three phases.
This not only upsets the electric utility companies, but can seriously screw up systems that use the AC line cabling for data transmission.
There is likely to be forthcoming European legislation limiting the allowed amount of waveform distortion caused by electrical equipment; makers of PCs etc. will have to fit better filtering.

Subject: Low Power No-License RF

Can someone please fill me in on the FCC requirements for low power transmitters that do not require special FCC licenses?

At one time, no special licensing was required for transmitters with an output power below 100 milliwatts. If this is still valid, it might be possible to cover large facilities with several transmitters, where a direct connection would be made to each transmitter. Of course multi-path reception would become a much bigger problem now if a receiving antenna could hear more than one transmitter. However, it might still be worth looking at.

Please advise restrictions, such as frequencies, ERP (effective radiated power), modes of operation (switched carrier, AM, FM, PSK, etc.), and other pertinent information, along with pros and cons associated with this approach.

Subject: Re: CSMA/CD
Date: >Fri, 31 May 1991 15:10:26 PDT

I have been toying with the so-called hidden terminal problem, and have written a tiny simulation that agrees with an analytic solution to the following problem:

>Assume I have magic radios that have a 0 dB capture range; that
>is, a receiver is either in range of a transmitter or not. Further
>assume that the range is a fixed, constant distance. If I have
>two randomly located stations that wish to transmit at me (i.e.
>they are both within range of me), what is the percentage likelihood
>that they will be within range of each other?

The question is of interest because whenever they are not within range of each other, it is inconceivable that they could determine (via their receivers) whether their transmissions to me are colliding -- they are hidden from each other.

I won't bore the list with the math (the trick is to intersect the circle that is within range of me with the circle that is within range of the first

station, then integrate the ratio of the intersection area to 2*pi for all the distances between 0 and 1), but the answer that both the calculus gives me (it's actually 3*sqrt(3)/4*pi) and the monte carlo simulation approximate is 0.586.

That is, 41% of the time (assuming the spatial distribution is uniform across the circle that's within range of me) the two stations can't hear each other. I thought that was an interesting number, and a bit higher than I would have guessed.

So if anyone else out there is thinking about collision avoidance algorithms, you can tattoo this on your arm. Carrier sense is a waste of time in this case.

(Of course it _isn't_ a waste of time in some cases of interest, such as radios with nearly infinite range compared to the expected spatial distribution of stations....)

I've not yet seen the precise band plan that was approved at the recent
220 frequency coordinating meeting here in So Cal (which in itself is
rather strange - you'd think that would be made public almost immediately).

However, reports are that the plan keeps all the existing repeater allocations intact. That is, 222 to 222.01 is set aside for weak signal (EME, etc), and that 222.02 thru 223.38 are repeater inputs, and 223.62 thru 224.98 are repeater outputs.

I'm told that packet radio gets 223.54 thru 223.60 (4 channels), but that packet doesn't retain it's current busiest channel, 223.42.

That means that, if reports are correct, all existing links, FM simplex, SSB, AM, CW, and other uses of the band have simply been told to fit in the area from 223.39 thru 223.53, or else to just piss off.

There's no room for 56kb packet, spread spectrum, or satellites, except (of course) to simply place them on top of or between repeater inputs and outputs.

The vote was something like 67 to 1 in favor; even the packet radio representatives were duped into giving up the other plans that would have allowed even ONE 56kb channel (down from the two that had been available before the band shrunk).

I have to congratulate the repeater owners who managed to get this plan approved (no other plans were even voted upon, it is reported). They have come up with what will undoubtedly be the most ignored band plan in southern California history.

I've had several requests for the "white paper" on cryptographic authentication of BBS messages that I wrote recently in response to a query by Paul Rinaldo, W4RI, of the ARRL. Paul is the chairman of the ARRL Digital Committee, of which I am a member.

In case anybody can't tell, the opinions expressed here are my own.
--Phil

Paul,

This is in response to your request to the Digital Committee for comments on authentication schemes that might be used to verify the source and integrity of a message posted to an amateur BBS network. This letter consists of a quick tutorial on the various forms of cryptographic authentication, some personal judgements about their practicality and suitability for the problem at hand, and some personal opinions on the present regulatory situation.

The scheme that I talked about at the 1987 ARRL Networking Conference was for authenticating IP datagrams using DES, but the same principles apply to using any conventional secret key cipher to authenticate any kind of message. (By "authenticate a message", I mean verifyng that the message was in fact sent by the claimed sender, and that the message contents have not be modified along the way.) Such schemes require all the stations involved to share a single secret key. Without the key you cannot compute the proper authenticator for the messages you send, nor can you verify an authenticator received with an incoming message.

The difficulty of key management with a conventional cipher can range from "trivial" to "intractible" depending on the application. Key management is simple as long as there are only a few stations that need to generate or authenticate messages, and all trust each other. For example, a DES-based scheme could be applied to a repeater to limit remote control to a few trusted stations. A single key known to the repeater would be shared by the control stations and kept secret from everyone else. An in-person meeting or the telephone would suffice for distributing the DES keys.

Now consider cases where the operators do not necessarily trust each other, e.g., autopatch operation. Since many more stations use an autopatch than control the basic operation of the repeater, its owners may want individual accountability. A DES-based authentication system could still work if each user has his or her own key. The same system could be used to control access to a BBS. In either case, the "server" (the repeater or BBS) keeps a complete list of keys for all authorized users and logs each access. This is more work than the previous case, but it is still entirely practical.

Common to the all these schemes so far is the assumption that only the server needs to authenticate a request, e.g., the repeater controller or the BBS. It must protect its users' keys against unauthorized disclosure, but since the resource being protected by the authentication system is the server itself, the owner of the server has an incentive to do this.

But in the more general case where individual pairs of stations must be able to authenticate each other, things get much more complicated. Each pair has to have a key that is known only to that pair; if you have N stations, you need a total of N^2 keys. All these keys must be exchanged by some secure means before authentication can occur, and they must be kept secret. To do this for every pair of amateurs in the

world is clearly impractical. And if you want *any* amateur to be able to verify the authenticity of, say, a broadcast BBS message (to carry on the amateur "self-policing" tradition, of course), there is *no* solution using conventional cryptography - the same key needed to verify a message could be used to forge one.

Some form of secret key authentication might still be practical between neighbors in a packet backbone or a BBS autoforwarding network. But this would only authenticate your immediate neighbors; it would not authenticate the origins of the traffic they pass from other nodes. For example, one BBS sysop could create illegal traffic and then pass it to a neighbor claiming that it originated somewhere else, and there would be no way to disprove this. So you really do want the authentication to be "end to end", not "hop by hop", and we're left with an unsolved key management problem.

One way to reduce the N^2 key problem is to establish a "key distribution center" that maintains a list of all the users' private keys. Users wishing to authenticate themselves to each other do so by first authenticating themselves to the KDC. The KDC then generates a "session key" (a random number) and sends it to the two parties encrypted in their own keys. The parties then decrypt the session key, yielding a shared secret that can be used for authentication. Still, only the parties involved can authenticate each other; someone listening in could not. (In most environments, this is an advantage; somebody else's conversations are none of your business.)

MIT has developed a system based on this model called "Kerberos"; it is in operation at MIT and elsewhere (the code is free). Nevertheless, it has the drawback that authentication depends on the availability and reachability of the KDC. But the fact that the KDC must have a complete list of the users' private keys works against deploying multiple KDCs with copies of the database for redundancy; the more KDCs there are, the more opportunities for the database to be compromised. The scheme also assumes that all of the parties (the two users and the KDC) have the ability to communicate with each other in real time, a bad assumption for amateur packet radio.

So the inescapable conclusion is that authentication schemes based solely on private key cryptography are of limited utility in amateur packet radio; they cannot solve the general problem. Fortunately, there is a new alternative: public key cryptography (PKC). In PKC, the keys used for encryption and decryption are different. Furthermore, knowledge of the encryption key, Ke, does not imply knowledge of the decryption key, Kd; in fact, the algorithms ensure that it is extremely difficult to determine Kd from Ke. The combination of Ke and its corresponding Kd is called a "key pair"; for this reason, public key cryptosystems are sometimes called "dual key" ciphers, as opposed to "single key" ciphers like DES.

The leading public key scheme, RSA, was invented by Ron Rivest, Adi Shamir and Len Adelman while at MIT. They hold a US patent on it that is being exploited by RSA Data Security, Inc. (There is no patent

protection on RSA outside the USA).

The original idea behind RSA was to allow you to publish Ke (hence the name, "public key" cryptography) so anyone could send you a secret message without prior arrangement. As long as you keep Kd secret, only you can decrypt it. But when used "backwards", RSA can also do authentication. If you encrypt a message using Kd (your DECRYPTION key, known only to you), then anyone can decrypt it using your Ke (your public ENCRYPTION key). Anyone who decrypts such a message then knows that whoever generated it must have known your Kd. This procedure of using RSA in reverse is called "signing".

In practice, it is not desirable to run an entire message through RSA to authenticate it because it is very slow, much slower than secret key ciphers like DES.

There is a better way. Functions exist to quickly "hash" a message of arbitrary length into a relatively small, fixed size "message digest". They are much like cyclic redundancy codes (CRCs) except that they are much more complex because they are designed to detect intentional "transmission errors" as well as natural ones. With a good function, it is computationally infeasible even for someone who knows it to produce two messages that hash to the same value, or to determine the input that produces a given value. They are not ciphers, because they have no key and their outputs cannot be "decrypted".

One message digest algorithm is MD4 ("message digest #4") by Ron Rivest, who has placed it in the public domain. MD4 takes a message of any length and produces a 128-bit (16 byte) result. Rivest conjectures that it would take on the order of 2^64 operations to find two inputs that hash to the same value, and 2^128 operations to find an input that hashes to a given value. These are impressive numbers, so if the algorithm holds up under analysis it should be quite secure in practice.

Given RSA and MD4, one authenticates a message by first computing its hash code with MD4. Then RSA is used to "sign" the hash code (by encryption with the sender's private key, Kd) and the result is appended to the message. The party wishing to authenticate the message also computes the message digest. It then decrypts the encrypted message digest received with the message (using the published key of the sender, Ke) and compares it to the value it has just computed. If they match, the message is genuine.

There still remains the problem of distributing the public keys. Although they may be freely read by anyone, they must still be protected against modification. Otherwise someone might forge a signature of a message under someone else's name using a public key/ private key pair of his own creation; if the receiver can be duped into accepting this bogus public key, then he will believe that the signature is genuine.

One way is to publish the public keys as widely as possible, in so many

places that no one could possibly modify all of the copies of a particular key that reach the intended target of a deception. For example, the keys could be published on CD-ROM, or they could be listed in the back pages of QST. But these schemes have two drawbacks: cost and time.

Another refinement, "certification", addresses this problem. If a "certifying authority" can be set up to sign the public keys of individual users with its private key, then only the public key of the certifying authority needs to be widely published. For example, the ARRL might select and publish its own public key in QST. It could then accept public keys from individual amateurs (accompanied with some non-cryptographic form of authentication, such as a notarized statement). The ARRL would sign the individual public keys with its private key and return the results. Note that the ARRL need NOT know the individual's private keys.

The signed public keys are known as "certificates". They can be distributed by the users themselves (e.g., in a mail header) because anyone can readily verify their authenticity with the published ARRL public key. This eliminates the need for an online KDC. The ARRL's workload might be a problem, but a solution exists for this too: a hierarchy of certifying authorities. For example, each League Division might act as the certifying authority for the amateurs in its area, using a Division public key that has been certified by ARRL HQ. Divisions might further delegate the workload to their constituent Sections. The verification of an individual user's certificate would therefore require the certificates of all of the certifying authorities in the hierarchy as well as the published key of the ARRL.

So in theory, anyway, authentication based on public key cryptography solves many of the problems associated with the earlier secret key schemes. However, many practical obstacles would still remain:

1. The RSA algorithm is patented in the USA, and the owners of the patent are holding it fairly close to their chest. Negotiations between RSA and the Internet Activities Board (IAB) have been dragging on for several years now over an agreement for the use of RSA in the Internet. It is not at all clear how much the patent royalties will be, or how they will be charged. (The leading theory is that the royalties will be tied only to the issuance of certificates, not to the actual implementation or use of RSA, but this is not yet final.) Would the use of RSA in amateur packet radio (resulting in the payment of royalties to RSA DSI) be considered as furthering the "regular business affairs" of RSA DSI? (Hopefully not, but considering some of the FCC rules interpretations we've been seeing lately...)

2. The algorithms are, by amateur standards, quite complex. At a minimum, they would probably require every amateur to have a PC-class computer to hash and sign messages. Given that a major reason TCP/IP is still a relatively esoteric mode in amateur packet radio is the reluctance of many amateurs to upgrade from C-64s and "dumb terminals", it seems unlikely that universal user authentication could happen any

time soon. And I won't even *begin* to discuss the user education issues.

3. Even if a full-blown RSA-based authentication system as described earlier could be deployed, it is not clear that it would solve the specific problem that originally prompted your query. Someone accused of posting an illegal message to an amateur BBS could still claim that his secret key had been stolen and used by someone else. Or he could accuse the local "Section Certification Manager" of signing a bogus public key with his callsign on it and using it to "frame" him by sending verboten traffic. Even if a key really has been stolen and the owner notifies the certification authorities, how do they spread the word that the previously distributed public key is no longer valid? These issues are still the subject of much discussion in the research community. Furthermore, this technology has yet to have its first test in a court of law.

In sum, although I find cryptographic authentication to be a fascinating topic that has some potential for use in amateur radio, I do not feel that it is "ready for prime time". Mandating its use at this time would be an enormous overreaction to the "problem" of controlling inappropriate BBS traffic.

Quite frankly, the FCC's heavy-handed behavior in this case has me greatly concerned. I think they're going after a fly with a battleship. I do not know whether they sincerely believe that they're "protecting" amateur radio or if they have some more sinister motive. I can only hope for the former, so we can reason with them. Every new development carries with it some risk of abuse; the more powerful the technology, the greater the risk. Amateur packet radio is no exception; even in its presently primitive state, it is useful enough to tempt some commercial entities to abuse it. We should be able to convince the FCC that requiring unrealistically stringent mechanisms to prevent even the occasional commercial abuse of amateur packet radio runs the far greater risk of destroying all of the good that it can do.

Lately, several of us (WA8DZP, K3MC, N6RCE, NG6Q and I) have been taking a close look at the low power spread spectrum modems that are rapidly becoming available for use under Part 15 rules on 902-928 MHz and other shared ISM/amateur bands. In my own opinion, building high speed (say, 100-500kb/s) metropolitan area networks under Part 15 rules seems entirely feasible, even with the 1W power limit - given proper design and engineering (good sites, directional antennas, power control, efficient channel access methods, etc). True, the performance of the existing generation of equipment is disappointing, mainly due to the lack of receiver processing gain in most models. But with the new FCC rules mandating the use of "true" spread spectrum receivers, plus the commercial drive behind this industry, it seems likely that the cost/performance ratio of this equipment will rapidly improve. Unfortunately, the same probably cannot be said for amateur packet radio gear, where the large scale production of inexpensive, high speed radio modems seems as far away as ever. Hence our initial interest in this technology.

But this latest blow from the FCC is making Part 15's complete absence of licensing requirements, content and/or usage restrictions look mighty attractive indeed - even though my primary intent is to use the network for the kind of personal experimentation that has traditionally been done in the amateur service. Are the FCC's rules really "protecting" the amateur service if they scare off those who are most interested in making technical contributions to the service?

I think it's time that the FCC not only remove the burden of responsibility for content from automatic relay stations, but that it loosen up its draconian definition of "business communications" as well. A lot has happened to the telecommunications industry since the Eyebank Docket; in particular, it is certainly no longer the job of the FCC to protect a telephone company from "lost business". The amateur rules should be pragmatic, with the realization that absolute prohibitions do far more harm than good.

A simple "hams shalt not sell communications services" rule should suffice to make any abuses self-limiting, as few hams I know would be willing to use their time and their stations to help make money for others if they didn't get a cut of it. Such a rule would be far clearer than the present "no business interest" rule. The current rule has spawned an entire generation of armchair amateur lawyers who revel in interpreting the rules in the most restrictive fashion possible. One only need look at how the field of computer networking is pretty much passing amateur radio by to see the chilling effect of the present rules.

73,

Phil Karn

Hello,

I have a USRobotics DIRECT 1200 modem that I don't use any more. I was wondering if there was any way I could convert it to work as a TNC. It has an RS232 port, and 2 RJ11 sockets.

The Radio Amateur Telecommunications Society (RATS) is pleased
to announce that the complete, source, executable and documentation
for the ROSE X.25 Switch by Tom Moulton, W2VY is now available for
non-commercial Amateur Radio use.

RATS encourages others to port the code to other platforms and to
use it to develop new applications in amateur radio and other areas.
Amateur Radio use of the code requires the developer to simply send
RATS the source code to the new environment or application for further
distribution by RATS as part of the growing RATS Open Systems Environment
(ROSE) platform. Other development uses of the code are also possible,
with licensing available through RATS. For further information contact:
J. Gordon Beattie, Jr., N2DSY at the address or telephone listed below.

Points of Distribution

The software will be posted to the RATS Bulletin Board System
at +1.201.387.8898.   login as "rats" and use xmodem.

Folks wishing to obtain the software via e-mail can contact
n2dsy@hou2d.att.com.   A uuencoded copy of the ZIP archive
will be sent to you.

ftp via the Internet will be arranged shortly.

RSWS0422.INF
.

The Radio Amateur Telecommunications Society is pleased to provide you with a complete archive of the latest version of the ROSE X.25 Switch software. Please follow the directions for unpacking this version of the software and you will minimize problems. If you have any questions please call Gordon Beattie, N2DSY at +1.201.387.8896 or via packet: n2dsy@n2dsy.nj.usa.

1. Make sure that you have about 2 megabytes of free disk space. You won't need to use it all, but it will give you room to play with the code once you explode the ZIP file.

2. Create the directory path "c:\SRC\RATS\ROSE0422". You may use another drive if you like, but this structure will keep you out of trouble when you get future releases of software.

3. With the ZIP file archive on a diskette use the following command to break down the ZIP archive onto your "c:" drive:

```
PKUNZIP -d a:\RSWS0422.ZIP c:\SRC\RATS\ROSE
```

4. Please note that the "-d" option will create the required subdirectories for you. If you have problems, make sure that the version of PKUNZIP is as current as the one shown below or later.

```
PKUNZIP (tm)    FAST!    Extract Utility    Version 1.01    07-21-89
Copyright 1989 PKWARE Inc.  All Rights Reserved.  PKUNZIP/h for help
```

5. Now go make something useful using this code and send us a copy!

I don't know why the local node (Netrom?) gives you a DM. Even
AX25L2V1 should still work.

MSYS's poor AX25 has become somewhat of a bad joke. :-(
I run it here and it has real problems. I can connect to 3 BBSes
from which I receive/send mail and they are all 2 digipeater hops away.
The links are somewhat "difficult" :-(

It's a real pity as otherwise the code is excellent. I use it here
to support 2 radio ports on VHF and a serial link to the Xenix machine.
It acts as the local gateway between the two local frequencies;

144.800Mhz 4800 baud and 147.575Mhz 1200 baud.

>bpq v 3.53 its changed some what! is it posible to use bpq-code
>in kiss input to get wa8bxn's msys code to talk ax25 v2 and make it
>work please any help to me

No you can't. MSYS doesn't support the packet driver you have to use.

You could try putting NET/ROM code into your TNC and using an nrs link
(NET/ROM async protocol). MSYS does support it however the instructions
on using it are buried deep within the bit in the manual on using the
MSYS Network code. (Around page 60 in the MSYS 1.10 manual)

Carl.

Did you set your callsign? If your TNC is identifying as 'NOCALL',
net/rom networks will DM you.

I recently got a "Kyokuto Denshi" VHF transciever (model something-146-
something). This is a crystal controlled radio with 12 channels.
The TR switching is with relays. Power out is about 7 to 10 watts.
Mobile style. The price was right.

Anyhow it has about 6 channels filled out with crystals and
I'd like to get it on packet. So I got some crystals for 145.07 MHz.
(It takes one each for transmit and receive.) Put the new crystals in
and, well it doesn't work on the frequency. In fact it doesn't seem
to work below 146 MHz.

So I took it apart and found out that the oscillator isn't putting out
the same voltage level on 145.07 as it is on 146.10; it's putting out
much less. Hence, it's not enough to drive the amplifier. Though it
is putting out a signal on 145.07MHz. So I'm about to try and lower
the operating frequency of the oscillator.

My question is: Before I dig into this, has anyone else done this
already and can tell me what parts to replace?

Thanks

Oh, I have schematics for the transmit and receive section (but not
the amplifier) already.

P.S. I understand that the IC22 is a crystal controlled radio for
146-148 MHz. Is this true? If so, is there a mod sheet somewhere
to get it to work below 146MHz? I hear that this radio is used
alot on 9600bps packet in socal.

Paul AA6PZ ask which TNC would you buy? I have purchased two of the
KAM TNC's and like them b=very much. I like the dual port capibility
and the service from Kantronics. Even here in Japan they take care
of me. I also like being able to be on the display freq and not
have to try and add or subtract for Frequency differences. It may
be operator malfunctions but I have tried and have seen others operate with
TNC's that cause the display freq on the transceiver to be placed on
a freq other than the operating freq.

I'm looking for some help in getting the NNTP client in NOS to work properly.

I want to restrict the newsgroups received to only a few so for example I do a
'nntp groups rec.radio.amateur.packet'. But instead of getting only articles
from that group, I get stuff from several other groups that I've never
specified. Anyone know how to prevent this from happening?

I also noticed that when our local newsserver starts the transfer, it starts sending with the oldest articles in a group. I presume this is because the nntp client has no current history of the received messages from a newly added newsgroup and so the history needs to be 'primed'. Is there any way of manually adjusting this history mechanism?

I'll shortly be moving from the UK to France (Grenoble, to be precise). Is there much packet or other activity in the area? I'd appreciate any comments on the amateur scene over there, email replies would probably be best.

Thanks

|> .....Ron
|> --

Just as another data point, I ran NET.EXE w/ DOS 3.3 & Desqview 2.31. Versions
910420 and 910423 both cause the rollover to the next day to
be lost. If I leave the system up but without NET.EXE running, the system catches
the rollover fine -- even i'm running something like a kermit
download at midnite.

I also can't figure out where it's happening. 8-(

>I will also place a (12 bit) compressed tar archive there in a day
>or so containing everything except the binaries (and with CRLF to LF
>bashing done on the text files) for the Unix crowd.

... which I have now done. I left the binaries in, and the npa.arc file
has been split out into its individual files in the npa/ sub-directory.

To get the files via anonymous FTP:

     nro.cs.athabascau.ca:hams/rose-422.zip
     nro.cs.athabascau.ca:hams/rose-422.tar.Z

If you have a uucp connection to aunro, try:

```
     uucp aunro!~ftp/hams/rose-422.zip ~uucp
     uucp aunro!~ftp/hams/rose-422.tar.Z ~uucp
```

For those of you who are still in the dark ages, nro.cs.athabascau.ca lives
at IP address 131.232.1.1.

I improved this scheme a few years back (remember when W0RLI still came
with source?) to make it slightly more secure.
Every time you log in, you make part of your key known. A determined hacker
could monitor all of this and re-build the key from the challenges and
the responses he collected in time.

What I did was sending the user multiple (in my case 3) challenges,

and requiring the user to fix one (but just one) of them, randomly picked.
Now, the guy monitoring receives an answer which is valid for one of these
challanges, but he doesn't know which one. He needs to get much more
challenge-answer combinations to extract the key and needs statistics
to do so.
This way, a key is much longer usable. Also, the techniques to re-build it
are slightly more difficult.

Maybe this gives someone an idea. I used it mostly for remote sysop work
(there was a time when we has some locals who thought it was fun to wipe
a BBS. I don't think they are still doing that now.)

I redid much of the time-of-day processing in those versions so it's
entirely possible that I introduced a bug. I'll go back and check.

I hate MS-DOS timekeeping. What a crock.

Merely realigning the IC-22A, note the A, will allow it to cover *any*
2 Mhz segment of 2 meters. For packet, just go in and tweak for maximum
smoke on your packet frequency. That will become the new center frequency
of the radio. For the IC-22S, note the S, some modifications are required.
The A is crystal controlled while the S is diode programmed synthesiser
based.

Has the topic of a 9600 regenerative repeater come up? Does anyone know what would be required? KC0OX mentioned wanting to do that recently.. Ron, speak up old man. Do the TEKK radios have split TX and RX strips, or must one use 2 of them? Has anyone gotten the whole idea plotted out? Perhaps Gracillis would do well to "can" the idea and sell it huh? I have NOT given up on the goal of a full duplex WA4DSY 56K system, BUT, we need something the masses can afford to get involved with.

If you have a response on this, please post it to the net and also CC: allmad@pgd.adp.wisc.edu 128.104.198.22 ..

Tnx a million!

Sorry for the delay of this summary. Final exams mugged me. :-)

Thanks for the letters, everyone. The simplest, quickest way to get rid of the birdie on 145.01 is to adjust the trimmer capacitance on the clock oscillator crystal. The MFJ I just wired up for a friend has a variable capacitor exlicitly for the purpose of shifting the harmonics a few kHz.

I noticed that my ZOOM 2400 telephone modem put out a nasty spur on 145.01 too. A couple of 33 pF disc ceramics shifted the birdie down to 144.98 MHz. (This circuit used one capacitor on each crystal lead.)

Some people suggested improving the shielding with proper bonding and grounding. This is always a Good Thing. Sandpaper, star washers, and screwdrivers are effective weapons. Stiff filtering of ALL leads entering the TNC is also a good idea. Toroids are generally sufficient. Snap-apart toroids are useful for those serial cables with DB-25 connectors.

One person even went so far as to filter the clock outputs inside the TNC.

That is more than I am willing to do, since the noise floor here in Honolulu
is pretty high anyway, and I can usually receive better than I can "talk"
(subject to pagers and taxicabs.)

Thanks for the help!

Here is a quick summary of nntp in the latest ka9q, from what I've been
able to gather from the source, and using the program. Oh BTW, a manual
bug, ping's delay value in the manual is in seconds, in the program it is
milliseconds, this can be embarrasing.

     Warren Toomey

nntp

Valid commands are: addserver directory dropserver groups kick
              listservers trace

nntp addserver <hostid> <seconds>

     Add the server given by the hostid; news will be sought after
from this server. The time in seconds holds the interval that nos waits
until looking for new news.

nntp directory <spooldir> <controldir>

     Tell nntp which directories to use for news. The spool dir
will hold the actual news articles. For example, if spooldir is /ka9q/spool
and you are receiving a group alt.foo.bar, articles in that group will be
placed in a file /ka9q/spool/news/alt/foo/bar.txt. The control directory
will hold the files `history' (those news articles that nos has received),

and `nntp.dat', which holds that date the nntp server was last checked.
Note that the bar.txt file is in a format that can be read as mail (e.g
with bm etc.).

nntp dropserver <hostid>

     Remove the named server from the list of nntp servers.

nntp groups <groupname> <groupname> ...

     This gives the list of groups in which you want to receive news.
You can have more than one of these commands. I think '*' stands for all groups.

nntp kick <hostid>

     Initiate an nntp session between nos and the server(s).

nntp listservers

     Lists the servers nos gets news from. The list gives the hostid,
the delay between checking for news, and the number of seconds left until
the next time nos checks for news.

nntp trace <0|1|2|3|4>

     Turn tracing of nntp on according to the given number, which has
the following meaning:

     0 - Turn tracing off
     1 - Serious errors are reported
     2 - Transient errors are reported
     3 - The nntp session progress is reported
     4 - As per 3, but the actual articles are displayed

Howdy! I'm a new Amateur Radio Operator (A Codeless Wonder, CW for short)!

:)

So, what I'd like to do is bend the ears of a few Elmers if I may...

I'd like info and discussion on the feasibility of hooking together my
AT&T 3B1 (a 10Mhz 68010 based UNIX desktop), KA9Q TCP/IP software (Which,
I admit, I don't have yet, can someone give me a FTPable site pointer?,)
a Kantronic KAM (3.x ROMS,) and a 2M/70CM radio.

I understand there is an internet out there. Does this mean it's got routers
and nameservers, etc...? Or must each site maintain a set of hosts and networks
and gateways files?

I'd like to be able to have such a configuration, but I'd like to be able to
switch to a async/tty connection to the KAM in packet mode so that folks W/O
the skills, money, and time to put into a TCP/IP based digital radio communic-
ations system can access the 3B1 to read news, or use email using any available
simple packet station.

Also, I'd like to be able to connect to my UNIX host in my office, by land line
to UUCP mail and news over.

The radio will be either a TH77A or a IC-W2A and in a month or two after
I get the radio, I'll get a AR270 Cushcraft antenna, and a RFC 2/70G AMP.
So, I think I'll be able to put up a reasonable and reachable digital
station (I don't want to call it a BBS)

A month or so after that I'll get a decent 35W or so mobile unit and
free up the HT for regular portable use (including, of course, a pocket
packet station :)

To best meet my needs, I'd like to be able to reconfigure from TCP/IP
to Packet easily, and as often as I like. I'd like to put up a cron job
that switchs modes . That way I can publish a schedule for users.

I'm really looking forward to serving the local Amateur community with
a lot of whiz bang stuff. I operated a multiline (as many as 4) BBS
(had a LAN in my 'shack' W/ 6 machines, and 6 phone lines, etc.. :)
I'm a Network Engineer for a living, so I should be able to do well
enough at this after I can get some info and discussion.

Any and all responses are most appreciated!

Hello all
I see in the digest lots of replies to me question on msys 1.11 ans ax25
Lev 2 Ver 1. In germany we have FLEXNET not NETROM and this will NOT
accept any type of ax25 Lev2 VER 1 !! in any form or shape !
In Europe and mostly in the UK all i hear is "Msys is really great"
BUT "We cant use it cos its VERSION 1 Proto" and "The author refuses
to do anything about it as HE does NOT like ver 1 proto"
OK if he dont want to use it can he at least put a soft switch in the
code so that those potential users who wish to use MSYS code can use
it with ver 2 proto and those who dont can use ver 1 proto
Is that Fair Deal or not ?
In my case i just cant use it in ver 1 proto the network here will not
accept ANY connects in ver 1 Cos FLEXNET dont support OLD proto's

Don't know if the other message/article was posted here, so I'll request again.
Does anyone know if a PACKET (either AX.25 and/or TCP/IP) gatewaye exists
between PACKET radio and Internet? If so, could someone please state where it
is located? If not, why has this not been performed? Additionally, what would
be needed in getting set up?

I'm preparing a list of "frequently asked questions" about amateur radio
TCP/IP, and this is prominent on it.

If you mean "connectivity at the IP level", the answer is "no, at
least not officially". The problems are both technical and legal. The
technical problems have to do with the addressing conventions used in
the Internet, particularly the amateur use of a class-A network number
(44) despite the AMPRNET being a collection of isolated "islands" of
activity. This is fixable, however, through a combination of "hacks"

such as encapsulation and/or source routing.

As for mail-level gateways, there is no technical problem; MX records pointing to a local gateway are all you need.

The much bigger problem is the FCC's rules on third party traffic and content screening. I see no solution to this problem short of reforming the rules to bring them into the latter half of the 20th century. In fact, given the FCC's recent crackdown on internal amateur-amateur packet networking, I'm sadly coming to the conclusion that a meaningful amateur TCP/IP network will never happen.

The Private Radio Bureau staff at the FCC seems to consider the amateur service as their own private regulatory fiefdom. If they do not "like" a particular application or use, they simply issue a decree against it. When you try to protest (e.g., at the FCC's so-called "forum" at Dayton) you encounter a brick wall.

Part 15 probably represents the best route for building a "real" packet radio Internet. You can encrypt, you can use it for business, and you don't have to be licensed. You can do a lot with 1 watt on 902 MHz, given good equipment, antennas and sites. Yes, it's a shame if we have to go this route considering that packet radio has been one of the few "jewels" in amateur radio's "crown" over the past decade, but the "amateur spirit" is often stronger and better nurtured in places other than amateur radio.

Phil

KA9Q supports simple AX25 connects as well as TCP/IP connections. Given the
source for KA9Q on your machine (no, I don't know where a current version is
available either), you should be able to hack an interface using PTYs (don't
know if your version of Unix supports this). Note that KA9Q runs in user space
rather than kernel space like the commercial TCP/IP packages so you must use
a "backdoor" approach to logins of any nature. On the 386 Unix version, you
can use the PTY trick, or you can let the user log in to the KA9Q package and
allow him to spawn child processes to do his interfacing with your Unix system.
This isn't at all secure. I have old KA9Q sources that say they work on 3B
systems in the Makefile. If all else fails, send me mail and I'll try to
arrange for you to fetch them. The latest should be on thumper.bellcore.com
however, in the pub/ka9q directory.

>Also, I'd like to be able to connect to my UNIX host in my office, by land line

KA9Q supports SLIP.

I'd urge you not to use a HT for a packet server. There are lots of
possible problems that can baffle even experienced hams. HTs can be,
and are, used by lots of folks, but it isn't optimum. You'll need to
solve RFI, overload, and keyup interfacing problems that can discourage
you quickly.

Good luck

Has anyone made Baycom work at 300 baud? I built a Bell 103 modem for HF
packet, but I haven't been able to get Baycom to see packets, even though
the signal looks pretty good on the 'scope.

What about PMP? I just started looking at it, and it requires a few
changes to get the timing stuff right (it's hardcoded to 1200 bps, and I
think there is a potential overflow problem in the 16-bit timer stuff for
the *slow* 300 bps).

Horse Pucky!!!

I ran the local BBS on an FT-470 for the better part of four months
with no problem whatsoever (that could be attributed to the HT :-)
The 470 locks on in TX mode very quickly. The slow squelch could be
a problem, but that's endemic to most rigs - whether they are base, mobile,
or HT's. Besides, most TNC support software carrier detect, so you just
run with the squelch wide open anyway.

Hello

There is more than 40 BBS in france covering most of the country with
good forwarding between them. The closest from Grenoble is probably
F6BIG-1 in annecy. Most of VHF activity is on 144.675 with some also on
145.275 and 144.650 MHz. Around Grenoble there is also a TCPIP subnet.

The most of the Nodes are using THENET but plan is to move to ROSE.
The move has already be done in the South West and is progressing.

There is a large TCPIP network around Paris (May be due to the
visit of N3EUA Bdale last year) 15 stations are 24h stations on
a total of 40 running TCPIP.

Consider this:

When MS-DOS wants to calculate the current time of day, it works
its way down to the BIOS to get the number of system ticks that have
elapsed since 00:00 (the system tick count is synchronized with
time of day). This tick count is obtained via INT 1A, AH = 0.

Well, INT 1A, AH = 0 also returns a flag (in AL) indicating
time has crossed 00:00 and MS-DOS uses this clue to bump the
day etc. When the BIOS returns the flag set, it clears it so
it'll be zero on subsequent calls.

The problem may be that NET.EXE is making INT 1A calls for timing
and "steals" the rollover flag from MS-DOS. If that appears to
be the case, then

    (1) replace the INT 1A call in NET with fetching the tick
        count from BIOS data area (with ints off since long fetches
        not indivisible):

```
        cli(); ticks = *(long far *) 0x40006cL; sti();

or (2)  when you see the flag is set, stuff it back into BIOS data
        area:
        if (r.h.al == 1) *(char far *) 0x400070L = 1;

(I use (1) and just thought of (2)).  No guarantees on the two lines
of code except I double checked the absolute addresses in the bios:
40:6C is dword tick count and 40:70 is byte rollover flag.

I am attempting to start some TCPIP activity in the local area. I DL'd a
copy of the NET dated 4-23-91. The problem I have is that the documentation I
have found does jive with this version of the NET. I have discovered the many
variants of of TCPIP that are around that confuse me even more.
My questions are:
1. Is there documentation for this version and is this version any different
   to the others around.
2. If this version has no documentation, what version is recommended for use;
   especially if on wants to turn the MBOX on and have some BBS activity on AX25
3. How do I turn the MBOX ON in this version of the NET and how do I get it
   to send a banner to a connecting station (on AX25) just like the beginners
   guide says.
4. What about the versions hacked by PA0GRI and G1EMM? Are these the versions
   that include all the bells and whistles and hence the ones to uses. I'd like
   to know the differences.

So many questions...I'd like to have a mentor to guide me.

Thanks, 73

This is indeed a bummer. Looks like we got a good conversation on this
subject brewing, but this is the first message in this thread I've seen
here. Conclusion: Gary Coffman's posts are not making it to UUnet. We're
directly connected, and have a full feed, but I didn't get his message
here, only the qoute in Lyndons message :(

At any rate, From what I can see here, Gary says that an HT isn't the
key piece of equipment for a packet station. I'd tend to agree that it's
not the optimum piece of equipment, but it should do for a few months till
I get another rig to dedicate to the task. I can only afford to buy one
radio at a time (!) so at first it will be the HT for setup and experimenting

then I'll plunk in an Alinco 110 or something for the long haul. (I think
I mentioned this in my message.)

Lyndon is quite right that my KAM has software carrier detect, so I don't
need to worry 'bout slow squelch (thoough I do believe the better HT's have
a settable squelch response) The interference from the computer and all is
very real problem, and one I suppose might be influenced by HT design
criteria.

Thanks for the response(s?) I look forward to hearing more... Specificaly
on the 3B1, KA9Q, and configuration specifics... Thanks!

It may look very good from a SoCal point of view, but I sure hope this plan, or something similar, doesn't get foisted on the rest of the continent. I just can't muster up any enthusiasm for a VHF/UHF bandplan that allots a paltry 6% of the band to digital modes. I know that the repeater pairs can be used for digital operation, but I think this plan is really inadequate as far as wideband digital operation is concerned. This apparently stems from a rather miserly allotment of only two 100 KHz channels in the previous SoCal bandplan, despite the fact that the ARRL Board approved the allotment of five such channels (at 220.5 - 221.0 MHz) in 1987. In contrast to the SoCal bandplan, the CRRL bandplan for 220-225 MHz which came out in 1989 recommends a total of 1.6 MHz for digital, all but 200 KHz of which could be used for wideband links. A similarly enlightened plan for 222-225 MHz should allot at least 1 MHz for digital. This obviously won't happen in densely-populated areas which are already chock-a-block with analog FM repeaters and links, but I firmly believe that they should not set the pattern for everywhere else.

Then again, there's talk of us losing the *whole* band in Canada, so this may all become a moot point. A look at a recent repeater directory will show how sparse 220 use is up here... we need to get more wideband digital going on this band, and soon.

>a problem, but that's endemic to most rigs - whether they are base, mobile,
>or HT's. Besides, most TNC support software carrier detect, so you just
>run with the squelch wide open anyway.

Like I said, lots of people do it. That still doesn't mean it will work
for you. Slow squelch is a problem if you use one of those TNCs with
the single chip modems rather than TAPR's original PLL. You can't run open
squelch on these TNCs without modifying the TNC. TAPR sells a little
daughter board kit for most TNCs. Software DCD is not very reliable and
you will often be held off unnecessarily wasting valuable channel time.
RF getting back into the audio line is often a problem because many HTs
use a plastic case and you can't shield them properly. Hash from your
computer similarly gets in the plastic radio. Many HTs simply can't handle
the duty cycle of an active packet station on high power and low power is
often inadequate to get the job done. And probably the worst failing of
all is that today's wideband receive HTs will overload severely if
connected to an outside antenna in a moderately high RF area like
being within a few miles of a commercial FM or TV station or near a
nest of pagers.

I've made various HTs work on packet, but it usually hasn't been simple
plug'n'play. On the other hand, nearly every base or mobile rig I've
tried *has* been essentially plug'n'play. Even old clunkers like the
IC22A or the KDK144 worked easily. Indeed, the old rigs with the narrow
frontends were often easier to use, weren't bothered by intermod, ran
decent power, and were much *cheaper* than a HT.

What I think is that you are quite correct. It _can_ be done with an HT,
as lyndon@aupair.cs.athabascau.ca points out. That's why I think it's
worth my time to get things set up, and in place using the HT (which,
of course, will be my introduction to the local HAM community (I know
a few, but not a lot) _and_ a workable vehicle for setting up the station.
Give me a two or three months and I'll have a dedicated 35-45 watt xcvr
set up with a power supply, and a battery system. (in case of emergency,
and for field day, etc...)

Thanks for the info here, I intend to take advantage of it, and much better
understand the myriad of ways an HT is not suited to a high efficiency,
reliable station.

Now, on to the Communications configuration of the host system, ka9q NOS
(TCP/IP) on a 3B1, and packet async connection on the same port, using
cron to time the TCP/IP and Packet Service schedule.

BTW, ThanksInAdvance y'all, appreciate the info and opinions!

What about the public key cryptographic systems?
I won't try to explain

the details, but the idea is that I pick my own secret
key and derive from it a public key. The math tells us
that a message encrypted using the public key can only be
decrypted by the private key. So, I tell everyone
in the world my public key. In particular, I can tell it
over the air to a sysop without caring about
eavesdroppers. Now anyone who wants to send me a message
uses the public key to encrypt it, and I'm the only person
in the world who can decrypt it. In particular, when I log in
to a node it picks a random challenge string, encrypts it
with my public key, and expects me to respond with the
decrypted string.

I defer to those far more knowledgeable than I to fill in details
or tell me why it won't work.

OK, I will revise my statement :-)

An FT-470 connected to a Kantronics KAM, running software carrier
detect in the TNC and open squelch on the radio works flawlessly,
subject to possible intermod problems (which we don't have).

What I was getting at was the tone of your posting, which implies
that an HT is worthless as a packet transceiver. In many many cases
that is simply not true.

MS-DOS v3.2 and earlier will not increment the date at midnight. It
doesn't matter how many disk accesses you do, it simply doesn't increment
the date. Change to DOS 3.3 or 4.x and the problem will go away. I've
been there.

Don't know if the other message/article was posted here, so I'll request again.
Does anyone know if a PACKET (either AX.25 and/or TCP/IP) gatewaye exists
between PACKET radio and Internet? If so, could someone please state where it
is located? If not, why has this not been performed? Additionally, what would
be needed in getting set up?

We have a sort of gateway here in Los Angeles on the duplex packet
repeater on 146.745 -600; k6jrr-3 [44.16.0.74], also n6are [44.16.0.81].
Pete feeds some of rec.radio.amateur.packet, tcpgroup, and hs-modem
stuff, as long as it's proper for ham radio. Julian excerpts whatever
he finds interesting and passes it along. Both will pass along mail
to the Internet from .ampr.org.

> If not, why has this not been performed? Additionally, what would
> be needed in getting set up?

Where were you the last several months? There was a thread that looked
like one of the suspension cables for the Golden Gate bridge!

Quick summary: If unsupervised, there are legal problems because:
 1. non-amateurs would be permitted unsupervised access to amateur
    spectrum;
 2. stuff that's OK on the internet (cusswords, business, etc) is

    NOT OK on ham; and
 3. a lot of other petty (IMHO) details.

A _supervised_ feed either way is OK.

 Yours,

>

Well, I'm starting to believe this is more of a BIOS problem than a DOS
problem. I have the same exact version of DOS 4.01 (from the same
distribution disks) running on two different machines. One machine is
a Zenith Z-147 (4.77 Mhz XT clone) and the other is Northgate 386-20
slimline. If PROCOMM is left running in terminal mode, connected to
a TNC on both machines..   the Zenith will slip days and the Northgate
will not.

An additional test case is an NEC luggable running NCSA telnet (in FTP
server mode) on top of MSDOS 4.01 which also slips days. The same
software setup on a Zenith Z-248 does not slip.

So, perhaps a closer investigation of BIOS types and versions is in
order...

Chris

Yes, it seems that 'bitftp@pucc.princeton.edu' won't serve you unless you are on BITNET. However, there is hope. Try the 'other' FTP mail server at 'ftpmail@decwrl.dec.com' (send a message w/ the subject HELP and the message body HELP).

|> What about the public key cryptographic systems?

Michael,

I recently wrote a fairly lengthy "white paper" to W4RI at ARRL in response to his call for comments on authentication systems. If there is sufficient interest I could post it here, but in the meantime I will give a quick summary.

1. Cryptographic authentication schemes exist, and they can use either single or dual key cryptography. (DES is a single key cipher; RSA is a dual key cipher).

2. Single key schemes are practical only in small scale applications, preferably where the authorized entities all trust each other (e.g., remote control of a repeater).

3. Dual key schemes that use certificates for public key distribution are potentially useful for authenticating packet messages, but these schemes are quite complex and require *every* amateur to possess fairly significant (by amateur standards) local computing capability

to execute them. (Consider that many packeteers still use dumb terminals or C-64 class machines with their TNCs.) The dual-key cryptography field is tightly locked up in patents. And I won't even *mention* the user-education problem...

4. Even a technically well-designed dual-key scheme can't deal with the problem of a user claiming that his secret key had been stolen and used by someone else to sign prohibited traffic. (Recall that WA3QNS has claimed that someone else posted the anti-war message under his call.)

5. And even if a perfect authentication scheme were devised, it would still not actually *prevent* the retransmission of prohibited traffic in real time. Only an AI program far beyond the present state of the art could do that. Given that there seems to be 500,000 different interpretations of just what the no-business rules mean (one for each ham), it is not exactly clear how one would program such an AI algorithm.

6. In short, although cryptographic authentication is a promising technology that is already practical for small scale use (e.g., repeater control links) it is simply "not ready for prime time" in the context of BBS message authentication. It is also a sledgehammer response to the "problem".

The real problem that needs to be addressed is an utterly inflexible FCC to whom the notions of "cost effectiveness" and "not throwing out the baby with the bathwater" are utterly alien.

Phil

Just ordered a TNC-2 (MFJ127xB ?). For some months I have been using my PC to do UUCP (WAFFLE) for email and news with the Usenet world.

Has anyone else been relaying and timesharing their PC between packet radio

and new/mail over usenet ? found or written gateway software ? Sure would
be neat to be able to ship some news and mail in and out. (No it is not in
violation of any laws or rules.)

Thanks for any clues. /Ev WA6CRE/

Last weekend I cross-posted a mod file from the net to the packet net.
Only problem is that someone else did the same thing with the same file
at about the same time. Which means that 2 copies of the same file are
floating around many packet BBSs. I figure one solution to avoid this
duplication is for the original newsgroup poster to make up and assign
a BID (bulletin identification) number. Such numbers take the form:

   $nnn_xxxxxx   or such similar. n= number x= letter

This BID is used by the packet BBS network to avoid duplicate copies of
the same bulletin arriving from different paths to be written into a BBS.
It will also make sure that only one copy of the same file that I crossposted
and someone else crossposted will be stored, if both cross-posters use the
same BID. And the only way for that BID to be the same is for the file

author to assign it. (or is there a unique number the newsgroup system assigns that appears the same at all sites that we could use?)

We crossposters should append a 1 to the BID, so if one of us decides to make multiple parts of the file (ie, part 1 of 3, etc), and another one of doesnt, the first part BIDs still match.

Just want to avoid duplication while still providing acess to interesting info. 73 de WA2ISE

Someone was wondering about authentication systems such as Kerberos - well here's a brief absteact from a recent paper on the subject.....

Kerberos basically makes use of the concept of an 'authentication server' (which may be a physically separate machine, or a 'service' running as a process on your target device).

The following brief discussion makes many mentions of UNIX but this is not 'obligatory'.

Reprinted with permission of Denis Russell, University of Newcastle.

> Kerberos was produced as part of project Athena at MIT, and is freely available within the USA. There are two versions of Kerberos that are relevant, versions 4 and 5. Version 4 is widely deployed in the USA. It provides strong authentication in an environment of networked Unix systems. Kerberos is used to secure Unix high-level networking protocols.
>
> Kerberos uses a trusted key server, and uses a version of the well-known Needham and Schroeder protocol sitting on the

Internet suite of protocols. The protocol is weakly dependent on IP in that the IP address is included in certain protocol exchanges in order to make the protocol more resistant to certain forms of attack. The encryption method used is DES. There are optional confidentiality and integrity services available.

Version 5 is an updated version of the protocol. There are many detailed changes, but perhaps the most important are that the encryption method can be chosen from amongst many; the underlying network may be of any suitable kind, including ISO; inter-organizational authentication mechanisms are more extensively developed; and several limitations have been eliminated.

Version 5 is in the final stages of specification, and several Unix manufacturers have committed to implementing the protocol. Kerberos has been adopted by the OSF.

The Kerberos protocols are in the public domain, and implementations of version 4 are freely available from MIT. However, certain US export restrictions forbid its export from the USA. The situation is complex, but it seems that versions of Kerberos that provide authentication only, and which cannot be used for confidentiality (i.e. to encrypt arbitrary data) are exportable. Thus, in order to avoid export problems, implementations of version 5 originating in the USA will only implement the authentication services.

Full implementations of version 4 are obtainable outside the USA. Usually there have been obtained by exporting parts of the system excluding the encryption routines (the so-called "bones" version) and then re-implementing the encryption routines afterwards. Implementing the DES algorithm is not hard. It would seem that full implementations of version 5 will either be obtained this way, or by implementing the system from scratch. No implementations of version 5, even partial implementations, are yet available (though DEC is committed to shipping a "USA-exportable" version soon).

Limitations of Kerberos

Kerberos is not a perfect system. The most comprehensive analysis of its limitations is in a paper by Bellovin and Merrit, and in the Kerberos email discussion list. The appendix examines several of these limitations and tries to put them into perspective.It is clear that these limitations do not mean that Kerberos is useless. To quote the introduction to Bellovin and Merritt's paper:

> "We wish to stress that we are not suggesting that Kerberos is useless. Quite the contrary - an attacker capable of

carrying out any of the attacks listed here could penetrate a typical network of UNIX systems far more easily. Adding Kerberos to a network will, under virtually all circumstances, significantly increase its security; our criticisms focus on the extent to which security is improved. Further, we recommend changes to the protocols that substantially increase security.

"Beyond its specific utility in production, Kerberos serves a major function by focussing interest on practical solutions to the network authentication problem. The elegant protocol design and wide availability of the code has galvanized a wide audience. Far from a condemnation, our critique is intended to contribute to an understanding of Kerberos's properties and to influence its evolution into a tool of greater power and utility."

As noted earlier, several of Bellovin and Merritt's suggestions have been incorporated into Kerberos version 5.

In summary, while Kerberos is certainly not perfect, it is by far the best system that is easily attainable, and is vastly better than nothing at all. To use an everyday metaphor - the fact that I know several ways of thwarting the security on my house and car does not mean that I should leave them unlocked.

References

[1] M. Merritt and S. Bellovin "Limitations of the Kerberos Authentication System" Computer Communications Review, Vol 20 No 5, pp 119-132, Oct 1990.

[2] W.Diffie and M.E.Hellman "New Directions in Cryptography" IEEE Transactions in Information Theory 6, pp 644-654 (Nov 1976).

In a way, Ethernet and packet-radio have a lot in common; they are both potential victims of aliasing. Fortunately, 'promiscuous' monitors for Ethernet are not as commonplace as they are on Packet (every TNC is easily switched to promiscuous mode!)
As to the implications of 'encryption', well, you are not actually passing real data in the 'encrypted' exchange, only transferring an authentication mechanism. So my reading is that you are not trying to obscure the meaning of any 'message' in the usual sense. The text of any session you then have once you have been granted access will, of course, still be in ASCII or whatever your system uses....

NOTE I am not a lawyer. I do not answer to the FCC. All people using the above information do so at their own risk.

Can someone in-the-know give me a breakdown of the % of 2 meter packet
communication that takes place at the various baud/bit rates? 1200,
2400, 9600?

Also, do the standard TNCs adapt their bit rate automatically (like a
telephone line modem) when connecting to a station at some arbitrary rate?
Or is all the activity at one rate anyway?

I can listen in on 145.01, etc, and hear the squawks, but I can't
tell much about the characteristics of the signals. I guess you
have to have a trained ear...

And, gasp!, does anyone know what the average throughput of a moderately
busy packet channel is at various baud/bit rates? How bad is it?

I have acquired a Cambridge Z88 (very cheap) and would like
to use it is a packet terminal. I need some advice:

1) Where can I get more information, programs, RAM, etc.
   here in the U.S.?

   2) How can this be used as a simple terminal for a modem
      or packet radio. I am having no luck with it terminal
      mode and would like to get in touch with someone who
      is using the unit in this manner.

      Please E-Mail, or if you like telephone me at the number
      below. Thanks very much.

Since the existing AX.25 BBS's exchange messages by logging on to the next BBS in the chain, then inserting the message nearly as a normal user would, there is NO way to prevent forgery of messages in the current system, even if user access to the originating BBS is verified. What would be needed would be authentication at each step of the message transfer.

With there being thousands of BBSs worldwide, and many different types of software in use, I would propose that it will be easier to get the US law changed than to update all the BBSs.

As more advanced methods of networking take over from the current stone-age BBS network in ham packet radio, we could build a message-exchange system which does make spoofing of messages rather more difficult. If we also require authentication of the users of the messaging systems, we're closer to the point where messages can be trusted. The sophistication, computational complexity, and cpu power required to do this increases with the degree of reliability and trust we want to have in the authentication. To be really sure will be really expensive.

However, and this is a point that cannot be repeated too often, we must learn that just because something is on a computer, it is NOT NECESSARILY TRUE! Too many people give credence to a message seen on a screen that they would never believe if it were told to them. If we, as hams - supposedly technically sophisticated individuals - can't understand that, how in Hell can the public be expected to cope? (Garbage in, Gospel out, as they say.)

Welcome to class B computing devices and radio. About all you can do is move the *harmonic* of the CPU oscillator somewhere else by tweaking it's frequency. Solder a gimmick capacitor across the crystal and twist until the signal moves off 145.01.

If the term "gimmick" is new to you, a short explanation. Solder two lengths of insulated wire, one on each of the two terminals of the crystal, and twist them together to form a crude variable capacitor.

Alas it were so simple. What i am proposing is some mechanism for authenticating
the person (attempting to) log into a BBS. At the moment, anyone can simply
set 'MYCALL G6WBJ' on their TNC, and then log into my local BBS pretending
to be me (and read my mail, or even worse, send offensive/indecent/illegal
mail in my name - which means that *I* could get closed down for something
i have not done).

What i am proposing is an 'encoded' (a phrase i prefer instead of 'encrypted'
as it upsets fewer people) exchange when you call the BBS, to give some way
of carrying out a verification process, this will in most cases show that
it is actually me who is logging in. Once this exchange has taken place
then the rest of the session proceeds in ASCII, EBCDIC, third-shift Cyrillic,
Hebrew or whatever representation turns you on. *THE MESSAGES ARE NOT ENCRYPTED*.

Admittedly this will not stop messages being altered 'in flight' (i guess
only sysops can do this) or 'eavesdroppers' watching what is being said, but
thats the least of my worries.

I am trying to find a way to get a fellow ham into VHF packet as cheaply as
possible (he has three young kids to feed, so it's got to be cheap!) He
has both a clone of the "original" PC and a Commodore 64. I've remember
hearing something about a software TNC emulator for the C-64. What is it,
how much does it cost, and how good of a job does it do? Is there anything
similar for a PC?

I assume that this question has been asked before. Please e-mail me
directly, and I'll post a summary if there's any interest.

Maybe I'm missing something but whats the problem with using a
Pass Word for protection? Granted some people can "break"
Pass Words but it does take time. If i change my Pass Wordoften
it becomes less likely that mine will be broken. If Phone BBS's
support Pass Word protection why can't Packet BBS's do the same?
I'm sure someone has the answer. Who gets the Cigar?

The reason, of course, is that with traditional (land line) BBS systems
the communications channel is somewhat secure, barring wiretaps. In
the radio world, you're broadcasting your password to anyone within
line of sight, who may be listening. Even if login authentication is
performed, the network itself is not secure.

That was quick. I've already gotten several responses to the message I posted asking for cheap ways to get into packet for either a PC clone or a C64.

My friend would prefer to use the clone, so it appears that the choices are "Poor Man's Packet" and "BAYCOM". One reply indicated that BAYCOM was the preferred program. Anyone have a different opinion? Are these programs public domain, share-ware, or what? Also, how do I obtain them, since I'm not able to ftp to outside machines from my company?

I understand both programs require a simple circuit requiring a few chips be built. Anyone know how much these components cost?

     The problem with using passwords over packet is that others can easily monitor the packet channel. So the first time you type your password to the remote Packet BBS, everyone on the channel can see it! So you change

your password every time you use the BBS. How do you type in your new password without everyone seeing it whiz by? I think you get the picture.

A simple authentication system that works well for packet goes something like this (this has been discussed at length already, so I'll keep it short): suppose you and the BBS share a password. This password is arranged off the air and never goes out over the air. Now, when you connect to the BBS, it "challenges" you with a random string or word. Now, you must take this random string, encrypt it with your password, and send it back to the BBS. The BBS compares your answer to what it thinks it should have gotten (remember, it has your password too). If it is correct, the BBS assumes you are you, because you are the only one who could have properly encrypted the reply.

Note that your password never went over the air, and anyone monitoring who saw this go by on the channel would *not* be able to pose as you. Why? Because the string the BBS asks you to encrypt is randomly picked and changes each time someone connects. Also note that the authentication in this example is strictly in one direction. You proved your identity to the BBS. You can also reverse the exchange to prove the BBS's identity to you, if you have a problem with people setting up bogus BBS systems....

One final item: this scheme is NOT illegal. The intent here is not to "obscure the meaning" of a message. Read Part 97 (for US hams).

Some years ago I purchased direct from the US, the Mactronics T-3 Terminal system for
RTTY and Amtor. I was using a faithfull old TRS-80 Model 111 at the time (still have it and it still works).

I now want to run the system on one of my 286 PCs and wrote to Mactronics fro details on obtaining the interface card to connect the modem to my PC, plus the

software driver. To date I have had no reply and can only assume that they have gone out of business.

I regard the T-3 as an excellent RTTY/Amtor system and would realy like to recycle it on the DOS system.

Can some one help with info on the interface card required for the IBM and with the correct software. Will pay reasonable costs to buy second material.

   Hello All,

I can see there has been a lot of recent discussion on high speed modems, both here in Tcp-Group and in other areas. A while ago I tried to start a mailing list for the 56Kbps modems, but there just wasn't a lot of interest (I guess the scope was a bit narrow). Anyway with a lot of the various manufactuers releasing some decent RF modems I thought I would give the idea one more try. I am going to start a maillist that is devoted to high speed modems (since not everyone many not want to run TCP/IP, though I can't imagine why :-) that run at speeds greater than 2400bps. Here is the information if you care to subscribe:

To subscribe or unsubscribe: hs-modem-request@wb3ffv.ampr.org

To send a messge to the list: hs-modem@wb3ffv.ampr.org

Well I guess I'll see if there is much interest in going faster than 1200bps over packet (I hope so)..

Hello all,

I just saw a message in the last packet radio digest that someone is finally putting together a mailing list for high speed modems and that in order to subscribe, I should send a message to hs-modem-request@wb3fvv.ampr.org.

When I tried to mail to this address our mailer gave me a host/domain unknown error. Could someone on the list (maybe the administrator of the hs modem list) please give me directions on how I can use another Internet gateway to cause mail to be bounced into wb3fvv? Or a better question yet.... is wb3fvv.ampr.org acessible from regular internet or is it just part of a local tcp/ip packet radio network? If it is part of internet could someone please send me the address numbers so that I can bypass the name server on our machine?

For what it's worth my Internet addresses are:

bad1679@ultb.isc.rit.edu and

bad1679@ritvax.isc.rit.edu (feel free to mail me at either).

>not able to ftp to outside machines from my company?

Up front disclaimer: I wrote PMP.

From the feedback I've gotten, the arguments for each tend to go
like this:

For BAYCOM:
- Lots more features than PMP
- Technically superior (e.g. doesn't hang the machine on TX & RX)
- More people using it

For PMP:
- "Aesthetically" better (e.g. nicer user interface)
- Uses parallel port instead of serial port (e.g no worry about
  RS-232 levels on your modem)
- FULL source code is available

Oh, one mark against PMP:
- little, if any support from author (PMP is "as is", I have no time
  to do any additional work).

PMP is available via anonymous FTP on 'helios.tn.cornell.edu' in /pub. If, as you say, you don't have Internet FTP, try using an FTP mail server. Send a mail message with the subject "HELP" and the message "HELP" to 'bitftp@pucc.princeton.edu' for details.

>I understand both programs require a simple circuit requiring a few chips
>be built. Anyone know how much these components cost?

Yes, both programs use virtually identical modems. The three popular types are Exar chip based (ala the MFJs), AMD 7910 (check a recent ARRL handbook), and TCM3105 (see Feb, 1989 issue of 73 for a design based on this chip). My modems are '3105 based: a chip and xtal can be had for $17 or so.

Here in the Bay Area, where 145.01 is heavily congested, the throughput is about 10 BPS (yes, 10 bits per second...) The percentage of packets that get through without retries is frightfully small.

My name server lookup gives the mail exchanger for wb3ffv as thumper.

Try: hs-modem-request%wb3ffv.ampr.org@thumper.bellcore.com

You're victim of an older, non-MX mailer.   wb3ffv.ampr.org has a regular
net 44 address, *BUT* has mail sent to thumper.bellcore.com. Your
mailer has to understand this. Alternatively, you could try the hack of

hs-modem-request%wb3fvv.ampr.org@thumper.bellcore.com

as an address. Some day we'll get net 44 connected....

We use a cryptographic challenge in our commercial stuff. It works
like this:

1. the called system generates a 64bit random number and transmits it
to the calling system as a 16 digit hex number like this:

     challenge: 197FE8BA001573FE

2. the calling system then encrypts the challenge using DES and a key
known to both systems.

3. the calling system then transmits the response back to the called
system again using a 16 digit hex number:

     response: 185FEA4780BE3A44

4. the called system also does the same encoding and compares what
the calling systems sends as its response to what the called system
calculates. No muss, no fuss.

Since one is using a 64 bit random number, the likelyhood that the
sequence will repeat is VERY small. This can be implemented very
easily using the DES code that Phil Karn includes as part of the
KA9Q-NOS distribution.

I'm not involved in packet radio (when time gets free, maybe) but I did
give this issue some serious thought a few years back. I'm kind of
thinking out loud and from a VERY theoretical basis but here goes.
What about a variation of the so called "enigma" cipher scheme which
changes your password from login to login? This way, if anyone did
catch your 'passwd' on login session N, it would not do any good
since the 'passwd' would be different for login session N+1. It seems
that a 3 rotor enigma cipher with the user specifying the initial rotor
positions, number of steps to advance each login and direction for each
rotor might produce a scheme which, while probably breakable, would
certainly improve the present situation. This certainly has problems
of software at each end of the connection and methods to 're-synch'
if something went wrong but I hope my ideas do generate some
thought/discussion on the issue

The scheme I came up with is probably legal but too complex compared
to the not so legal one. I think it is time for a rule change.
Technology has clearly made the old rule counter-productive and a
change in rules or waiver this particular one in the case of BBSs
is in everyones best interests.

>This is an EXCELLENT scheme. Much simpler than the one I came up with.

     Actually, after a little generalization, the two schemes are virtually
identical. Think of it this way:

     With the method you described (in a previous message: using an
'Enigma'-type algorithm to change your password each time you log in),
suppose you pre-computed and printed out your next 500 passwords. So the
next time you log in, you would use password #1 from the list, then #2,
etc. Now, suppose the BBS prompts you with your login number when you
connect (e.g. "This is your 27th login, password please?"). You would
send the 27th password from your list to login.

     This is a version of the challenge/reply scheme I described. The
BBS is challenging you (with your login number), and you are replying with
the password that corresponds to the challenge.

     The variations are endless: you would probably want the BBS to
scramble up the password requests and not do them in order. Or, better yet,
the BBS would prompt you with multiple challenges, only one of which is
valid (e.g. "Login with passwords #0567 #6723 #4534 please", where #0567
and #6723 are bogus challenges).

Hi!

In Australia at the moment there is a growing movement to "rationalise"
the current crop of @ designators.

The problem is this, Australia has (roughly) split into two forwarding areas.
One based on the East Coast and loosly called VKNET and the other based
on the West Coast (also loosly) called OCNET (or just OC).

Due to the kind sponsorship of an unamed organisation there is a ROSE link
across the country linking the two groups together and the two designator
areas are starting to clash. It's not helped by the fact that the West Coast
handles mail to/from Europe while the East Coast handles mail to/from the
Asia/Pacific region and there is a fair amount of designator swapping
going on. For example a lot of mail is distributed in Europe with a
designator of @EU. Somewhere (and we have our suspicions) it is being changed
to @VKNET or @OC. The result we have a lot of useless European mail
floating around Australia. Similar things are happening with the Asia/Pacific
region except there also appears to be heavy censorship somewhere around the
gateways. (Virtually no USA bulletins, for example, make it through. :-( )

The proposals we have seen so far basically sum up to;
@WW   Designator for World Wide distribution.
@AUS Designator for Australia Wide distribution.
@ASIA Designator for Asia/Pacific distribution.

They may not end up being the actual designators however they will be something
similar.

I'd like to know how designators are worked out in the US and Canada and
what difficulties are currently being experienced in this regard.
Is there support for a @WW designator?
What bulletins should be forwarded between regions? (ie between the US and
Asia and so on.)
How well is heirarchical addressing working?
What heirarchical addresses are currently assigned (at a state level) and
how are they worked out?

Basically I'm after the above information to help me draft something for the
Australian network. I'd like to know something about other networks before
putting forward proposals locally that might impact those other networks.

I'm also interested in hearing from European Amateurs.
How many bulletins from the Asia/Pacific area make it to North America
and Europe?

Also are people interested in Amateurs in different regions posting a
description of their local networks? If so I'll post a description
of the Australian system.

I have a couple of quick questions about KA9Q 910414.

For some reason, the date does increment to the next day when passing
through midnight. Is this a bug in KA9Q, or perhaps a feature of MS-DOS?!

Does anybody know how to use the nntp functions properly? At the moment
I'm accessing my nntp server every hour for one newsgroup, but it only
found news on the first access, built a few directories in spool/mail.
Since then, no news. Also, the news is left as a single file with all the
news bundled in it. Is there any way of having the news appear as
individual files in a spool/news/... subdirectory.

Thanks for your help!

X-Reader: NETNEWS/PC Version 2.2

Re PMP and BAYCOM:

I have been using PMP for about 18 months and still use it in preference to BAYCOM except when the channel is BUSY. The user interface is much nicer with PMP (or alternatively it works the same way my brain does :-)

I tend to do an L for listing all the incoming bulletins /mail from a BBS and then scroll back up to find the ones I want to read. The limited buffer size in BAYCOM and the use of multiple keys makes this more awkward than with PMP as with a large number of incoming bulletins, the early ones are often lost (using BAYCOM).

Also, I tend to read articles and then decide I wish to save them which you can't do in BAYCOM, you have to open a download file FIRST, before reading anything. PMP lets you save the scrollback buffer instead.

One topic which causes problems with BAYCOM although it IS NOT BAYCOM'S FAULT is one of the local BBSs use of MSYS 1.10 which uses (I believe) AX25 level one. This doesn't set the final bit on the UA packet with the end result that you can't connect to it using BAYCOM - PMP doesn't care. Apparently MSYS 1.11 has fixed this ...

Neither BAYCOM nor PMP will let you download binary files using YAPP, XMODEM or any of the commonly used protocols - So you can see all these files on your BBS, you just can't get hold of any of them :-(

BAYCOM doesn't need a Data carrier detect, PMP does but this won't be a problem if you're using a 7911 or 3105 modem chip as DCD is available.

With regard to using PMP only when the channel's not busy, PMP disable the keyboard when either sending or receiving packets, BAYCOM doesn't. This is on a turbo (8MHz) XT, there may be enough time left on faster PCs to service the keyboard ...

Both work well .... (and I'm sure glad I didn't have to write them :-)

Cheers
Giovanni ZL2BOI

Do you really mean "does" or should it be "doesn't" ?

If the answer is "doesn't" then this rings a bell as a long-standing bug in MS-DOS, I think its fixed in a version later than 3.1 but I'm not sure. The symptom is that the date rolls over fine if the machine is off but if the system is running it does not increment the day number as midnight goes by.

Try getting the very latest version of MS-DOS.

Steve

At least one version of MS/DOS exhibited this characteristic (3.2 ???)

Another method of authentication works like this. Somehow a list of
(truely) random numbers (passwords) are created. These are like
pre-computed passwords except that they are not password variants and
do not cary the true password in any form. The exact method of
picking the passwords, or the password form is irrevelant except that
all the passwords should be random to each other and to their position
in the list.

The passwords are passed to the user over a secure channel and kept in
the BBS.

During initialization, the BBS asks for a password from the list and the user must provide the correct answer from the list as a reply. If it is correct, then user is allowed in and the BBS marks that entry so it is not to be used again.

Short of breaking into the BBS and finding the password list or getting a copy of the list from the user, this is not breakable.

If the passwords are used up in sequence, then the user can tell if someone else has used one.

jim, N0NKJ

Yes, I know this is just like (but a little different than) the others. Yes, I know that the BBS sysop can break this.

Comments about making truely random numbers should be sent to sci.crypt.

Could you provide more information? What kind of cabling are you using? What radio, etc?

I have a PK-88 sitting about six inches from my 1/4-wave mag mount antenna on top of a filing cabinet and have never had problems with birdies on 145.01.

The answer to this question is fairly obvious: when you call a phone-based
BBS, you are the only one on the line and others cannot monitor the line
and copy your password.

With packet, however, anyone on the same frequency can monitor your packets
and record your password. Radio is like the old-fashioned telephone party
lines.

It seems that MSYS is fraught with weirdities..... When one telnets to it, it
checks in its MSYSHOST.NET file to validate you. I made a hosts file
according to the spec and the sysop installed it. When I use my primary

address, it's OK. When I use hamgate.wb5bbw, it tells me I'm not in the hosts file. Does anyone know if it requires simple callsigns as the hostname in the MSYSHOST.NET file? The sysop has gone home after semester end, so it'll be a while before we can experiment.
If it requires simple hostnames, how does it specify "secondary" hostnames?
Or should I go somewhere else? 8-}
I guess I whould count myself lucky.... Before he put in the new hosts file, it thought I was WA4EWV, who is .0.52, not .0.5.
Curiouser and curiouser.....

kurt

     Actually, it is a know (at least around here) bug with MS-DOS.
If you don't do some form of a date/time request each 24 hours, then

MS-DOS loses days. It is because MS-DOS doesn't count how many times it
passes midnight, just that midnight has been passed, and doesn't
actually update the system's concept of the date and time until a date
or time request is made. Thus, running two days with out a date/time
request (about any file operation causes one) would cause MS-DOS to lose
a day.

     Neat, eh.. :-)

Thanks for the people who told me that the midnight bug was in DOS! I
haven't had any word on nntp yet. My next question is: can somebody
give me a termcap entry for the ka9q telnet `terminal'. It seems to
be a vt100-like thing, but ^[[? sends it into 40-column land. Would
looking through the source (which I can get) be of any help?

Thanks,

Howdy

Is there a FAQ list for this newsgroup? If so, could some kind soul
point me at it? Is it available via ftp?

If not, could someone please take a shot at the following questions?
Email is fine unless you think that it is of general interest.

1. What software is available for packet ... and what does it do?
     Protocol? Bells & whistles? Bugs?

2. What hardware platforms does it run on? 386 clone? 286? 8088? PS/2?
     Macintosh SE? IIcx? Amiga? C-64? VIC-20? SPARCstation? ;-)

3. What additional hardware is required? TNC? Homebrew modem? ???

4. How much does it cost? Registration cost if shareware?

5. Any other comments you care to make?

The problem in the latest versions of NOS doesnt follow this pattern at all.
On my PC system running DOS 3.2 the date didnt increment at all for over
a week until there was a power glitch from a thunderstorm yesterday and
I rebooted. During this time there were plenty of disk accesses going on,
the smtp timer and the mbox forwarding timers both cause a disk read once
an hour or so, and there were lots of writes to the log file. 73's Jim KB3KJ

Andy at DRSI mentioned to me this morning that they're making a new PCPA
card with both 1200 bps and 9600 bps modems on the card.

Anyone had a chance to play with one of these yet?

Hello just started to test and hope to use a nice bit of bbs code
however can anyone help me how do you get the code to use ax25 ver2
the entire soft package is some what usless in a ax25 ver2 network
infact if i try to use it to connect to the local node all i get
back in responce to a SABM is DM and busy from the node

i have been looking at the g8bpq code and have used it in the past
for a long time on my home bbs [gb7sau] but that was in the days of
bpq v 3.53 its changed some what! is it posible to use bpq-code
in kiss input to get wa8bxn's msys code to talk ax25 v2 and make it
work please any help to me
internet = btitmars@esoc.bitnet
ax25-bbs = dc0hk@db0ie.deu.eu
tcpip   = dc0hk@dc0hk.ampr.org [44.130.24.71]
thanks all

     The latest version of PMP can be found on 'helios.tn.cornell.edu'
in the /pub directory via anonymous FTP.

     If you don't have Internet connectivity, try the FTP mail server at
Princeton. Send a message with the Subject "HELP" and the message "HELP"
to 'bitftp@pucc.princeton.edu' for details.

I just purchased the Heathkit pocket TNC and was wondering if there
was freeware available for the PC to run it (especially if it's
available via anonymous FTP).

Please reply via email.

Thanks

jim

I am trying to decide which model TNC to buy. Does anyone have any
recommendations? Is one brand or model especially better than the
others? or are all the ones with similiar features about the same?

I suppose you could modify a battery powered radar detector to monitor
packet radio on 10 or 24 ghz, but i don't think the components are
beefy enough to handle transmitting as well.

I'm almost sure (99.9%) that the Z53C80 is the same as a very well known NCR
SCSI chip - 5380. It's a _standard_ SCSI device and quite well behaved.
One thought - both chips come in 40 pin cases, so the combination might be
hard to use: I mean PGA is not very nice for home projects.

The SOLO by Cinncinati (sp?) Microwave is an great Radar Detector that is
batery powered.

You can only get it through the company, so give them a call.

Good Luck,

Found the following bulletin on my BBS today:

Some time ago Tom Clark W3IWI gave a paper which recommended the use
of 4 letters rather than 2 for the Hierarchical Continent Address
Designator.

Trying to cope with two sets of addresses does add to the sysop
chores. So I reviewed the 1640 BBSes that have been accumulating in my
Lookup file. This list is maintained by daily parsing of the headers.
Here is what I found. All stations in my list used either AF AS EU OC
SA or NA with the following exceptions.

6Y5EW.#KIN.JAM.CAR
6Y5RA.#KIN.JAM.CAR
5 BBSes in MD NOAM
1 BBS   in NY NOAM
1 BBS   in MI NOAM
1 BBS   in TX NOAM
1 BBS   in FL NOAM
1 BBS   in NM NOAM
1 BBS   in IN NOAM
1 BBS   in VA NOAM
1 BBS   in KY NOAM

Thats it. 15 out of 1640 BBSes are using the 4 letter designator.

A/B switch to cross switch mod file

Lately, in my packet/phone modem/8bit home computer (with modem software that can store and load from disk) system, I added a VT100 terminal I got at a hamfest. This will let me view stuff using 80 characters across the screen, instead of always having to use the 40 characters the home computer does. Before I got the terminal, I used an A/B RS232 switch that switched all 25 wires. Now, to accomodate the terminal, I need a switch that can select connections of 8bit to TNC, 8bit to modem, terminal to TNC, and terminal to modem. A cross connect switch. Which would cost something like $25. I decided to see if I could modify the A/B switch. I use software Xon/Xoff flow control, which needs only 2 active lines and a ground. So, I need only switch 2 lines. Looking at the '89 ARRL Handbook, page 19-28, table 15), it

shows the functions of all 25 RS232 wires. The ones I use are pin 2, TxD, and pin 3 RxD. Also pin 1, protective ground, and pin 7, signal ground. But there is a secondary TxD, called STxD, pin 14, and a secondary RxD, called SRxD, pin 16. So, I figured, I would connect the TNC to the common of the A/B switch, to the primary TxD and RxD. And connect the phone modem to the secondary TxD and RxD. (I would need to make a special Y shaped cable to do that.) And connect the 8bit machine to the primary TxD and RxD of the A connector of the switch, and the VT100 to the primary signals of B.

   Here's the mod to make this work:
Wire a jumper from the A connector pin 2 (TxD) to B's pin 14 (STxD).
Another jumper from A pin 3 (RxD) to B pin 16 (SRxD).
And another from B pin 2 (TxD) to A pin 14 (STxD).
And a last jumper from B pin 3 (RxD) to A pin 16 (SRxD).
I also shorted all pin 7's together, and shorted all pin 1's together.
(This avoids switching spikes in the grounds that might glitch the equipment.

   Now make the Y cable:
pins 2 and 3 of the "common" connector go to the TNC connector pins 2 and 3, respectively.
Pins 14 and 16 of the "common" connector go to the phone modem connector pins 2 and 3, respectively.
All pin 1's are connected, and all pin 7's are connected.

Label the modified A/B switch to describe what you did, so you don't try to use this switch to switch printers or something years later.

My switch was an Inmac, with all original wiring traces on a circuit board. All mods are added jumpers, and no cut traces. So, this switch could be restored later if I need to.

Just to add my 3 cents worth. After i arrived in Japan and got up
on Packet, I had a friend of mine who use N8GTC in Indiana used
NOAM so when i sent a return msg, i got a note from VK4BBS telling
me in no uncertain terms that NOAM was not correct and to only use NA.
So wwhat is correct ? Why would we want to use 4 characters instead of
2? I have a short memory HI HI. If we in the U.S. use 4 ltr and the
rest of the world uses 2 it would sem to me that this would lead to
even more confusion. There is enuf confusion in the world lets not
add to it!!!

  What is the current wisdom on All-Mode RS-232 boxes for HF and/or VHF?
I would like to acquire one but I don't know the pros and cons of various
manufacturers. Are they all about the same?   mfj, AEA, HeathKit ?
I am looking for comments about your experience with such units.
       thanks & regards,
                        Bill Moyer

Oh dear... Brian strikes again. :-(

Brian Beamish, VK4BBS, is the head of the "Asianet Sysops Organisation".
This organisation is basically a loose group of HF sysops clustered around
the pacific basin excluding the US and Canada.

Unfortunately he is a major link in the Australia<->US/Canada/Japan/etc
forwarding scene. He has a rather brusque manner. :-(He was also almost
simgle handedly responsible for Australia (and New Zealand etc) using

.OC instead of the proper continent designators. :-(

Here in Australia, I've heard no no mention of the 4 character country
designator. I might mention however that virtually no US bulletins
make it down here.

Anyone interested in making a US<-internet->Australia forwarding path? :-)

Carl.

There is a 5-part message from Tom, W3IWI floating around concerning the
latest FCC action regarding the January problem of automatic forwarding of
a message apparently violating FCC rules. Since only 2 of the 5 parts
have arrived here I sure would appreciate seeing it posted here in its
entirety.

In that I am one of the stations covered by the current STA for unattended
HF operation (14.109 Mhz) I have a lot of interest in the subject. Judging
from what I have seen in the 2 parts of Toms message the only options for
those of us operating unattended may be to terminate operations. Putting
all messages on hold for SYSOP review puts a tremendous burden on the local
SYSOP and slows message distribution considerably. In the short term that
solution (hold for review) may work but in the long-term is not workable.
Comments from SYSOPs involved with the problem?

I've been ill in bed for the last few days and running short of light reading material. So, I picked up QST "devoted entirely to amateur radio". Despite pain, psycho-tropic drugs and boredom I made it to page 27. In the bottom half of the page is the "New Products" column. Ah! New DSP chips? a cheap dish? No such luck. Sitting there in a photo are two Morris Keys. These keys, a paddle type and a straight (up & down) type are hand crafted and made from modern materials like Bakelite, wood, aluminium and brass. The price of the keys is between $70 and $100.

I wonder if that includes error-correction circuitry?

But then, how do we measure pleasure? How do we evaluate the truth and veracity of religion?

After a quick kip I made it through to page 163 (Not marked by QST for some reason). There I saw that MFJ had an electronic keyer/key combo for $134.95, PSU $12.95 extra.

Page 165, (Still no damn number QST) has a 1200 Baud TNC for $139.95 - and PSU included. Error correction circuitry also included.

And now back to the National Enquirer to see what Liz and Dolly are up to.

Date: 30 Apr 91 03:13:56 GMT

Organization: Carnegie Mellon, Pittsburgh, PA
Lines: 25

Hello, all.
    I'm posting this for a moderately sizable group of people. Quite a few of us OS9 and Color Computer users are also (or want to be :-) ham operators. After a discussion on our network bulletin-board, we decided somebody should ask around, to get us all started in the right direction. We want to use packet-radio in conjunction with the Tandy Color Computer, running under the OS9 operating system, as well as other computers running this same operating system. It's very similar to Unix.
     Our question is thus: Does anyone know of already existing software for doing packet radio under the OS9 operating system (whether or not specifically for the Color Computer). If so, where can we get it? If not, is there Unix source available, as this would be most likely the easiest to port from.
    Also, as many of us are novices, we'd like to know basically what is necessary to get started in packet radio, and where to get information on the subject. I've heard that there are certain packet controllers that do most of the work themselves, and all you need is a terminal. Is this true? I know these are all FAQ, but i didn't see an FAQ list on this board.

Thanks for any help!

Organization: US West NewVector, Bellevue, Wash.
Lines: 38

Well, I have now compiled and linked the Unix Sys5 (SCO) version of the KA9Q software, and have a few lingering questions. Perhaps someone out there can give me some answers. If you feel that it's of general interest, post; or email me and I'll sumarize.

1) I was under the impression that the NOS was a TCP implementation for Amateur packet and not much else; however, there is a lot of code (some of which got compiled into the Unix version) that supports (or seems to support) ethernet cards and other "local" network stuff. Is there more to NOS than I'm seeing?

2) I'm faced with having to write my own "attach" routines (to deal with a multiplexed serial port) and have a couple of questions:

    A) Does the NOS assume that by the time attach runs, the TNC is already in KISS mode, or does it rely on attach to send the KISS commands.

    B) Is there any way to "suspend" a session (ie, "temporarily" unattach)?

3) Is there any way under NOS to just talk out the serial port to the TNC directly?

4) Will the Unix version of NOS talk only to BM, or can it use the standard Unix mail handlers (like mmdf)

If all of these questions (probably) are covered in TFM, I apologize in advance. If someone could point me at tha Unix specific version of TFM, I'd appreciate it (we only have uucp here, so it would be helpful if it was on an archive that supported uucp).

Thanks in advance!

Hi,
My name is Marc and I am new in the Newsgroup.
I would like to know if there is a gateway existing here in europe which
could allow me to mail my uncle in Austria, who is 24 hours online via
packet radio.
I am at the University of Sussex, ie connected to JANET.
Is there a possibility to reach my uncle or some other radio amateurs using
packet radio ?

I've got a TNC-1 running in KISS mode which has a tendency to lose received
packets. It doesn't lose all of them but just enough to be annoying. When the
old EPROM (non-KISS) is restored, it works just great - no lost packets. At
first I thought there was a problem with the KISS EPROM. Other people
suggested that it might be a problem with a bad HDLC chip that can't handle
the KISS code.

Well I was able to get my hands on a friend's TNC to check out both the KISS
EPROM and the HDLC chip and it turns out both chips are OK. In fact I ended
up swapping all the other chips in the first TNC into the second TNC and
they all work fine. Put the chips from the second TNC into the first and it

still doesn't work reliably. The symptoms are consistently reproducible but they don't move with the ICs.

So where does that leave me? The problem can't be caused by the ICs. It's probably not a problem with the modem 'cause the thing works in non-KISS mode. But it must be something that is exercised by the KISS firmware but not used or required when running the TAPR TNC-1 command set in the old EPROM.

Would appreciate anyone out there who has some knowledge of the TNC-1 KISS firmware shedding some light on this problem. Thanks!

PK232CMD.LST (PART 3)

KISS (ON/OFF)   DEFAULT: OFF
KISS protocol eliminates most of the PK232 software, and sends raw HDLC frames up to the host computer.
The bulk of AX.25 (or other protocol) must be done on the host computer.
ON - PK232 operates as a KISS TNC.
Forces HPOLL OFF (temporarily), PPERSIST ON, RAWHDLC ON, and HOST ON. RAWHDLC ON temporarily forces CONMODE TRANS, TRACE OFF, HID OFF, and NO Beacon. HOST ON temporarily forces 8BITCONV ON, AWLEN 8, PARITY 0, and no software flow control.
To exit KISS mode, type (3) <CTRL-C> all within 1 second.
HOST OFF (3 Ctrl-C's) forces KISS OFF.
PK232 CMD and PKT LED's will be lit confirming exit from KISS mode.
"Temporarily" means that PK232 will behave as if the

function is set that way, even though the function setting does not change.

OFF - PK232 operates as a normal AX.25 level 2 TNC.
In KISS and Raw HDLC modes, communication activity on the RS-232 link is shown by the illumination of the STA and CON led's as follows:

STA led lit: Host to TNC communication.
CON led lit: TNC to host communication.

KISS mode is used to run TCP/IP.
To run TCP/IP, the following parameters must be set:

```
AWLEN 8
PARITY 0    Enter if terminal word length and parity
RESTART     is something other than 8 bits
-------------------------------------------------
TRACE OFF         Enter if commands have been
HID OFF           changed from default settings.
BEACON EVERY 0
PACKET
-------------------------------------------------
CONMODE TRANS     Enter these commands with HOST ON
PPERSIST ON       command entered last.
RAW ON
HPOLL OFF
KISS ON
HOST ON   (must be entered last)
```

MAILDROP ON/OFF DEFAULT: OFF

ON - PK232 operates as a personal packet BBS.
OFF - PK232 operates as normal AX.25 Level 2 TNC.
8000 bytes of ram are available for the mailbox. The ram can be used for a single message or up to 15 messages.
Power on/off, RESTART or RESET clears all messages in ram.
Mailbox commands:

B - BYE Log off the Mailbox
K - Kill or delete messages.
L - List the message directory
R - Read a specific message
S - Send a message

MAXFRAME 'n' DEFAULT: 4

'n' = 1 to 7
Sets the upper limit on unacknowledged packets the PK232 permits on the radio link at any one time. Also sets the maximum number of packets the PK232 will send during any given transmission.

MBELL (ON/OFF) DEFAULT: OFF

ON - Will send 3 bell characters to the terminal when the
call signs of the station monitored match the MFROM and
MTO lists.
OFF - PK232 will NOT send any bell characters to the terminal
as a result of monitored packets.

MBX call1 [,call2] [-'n'] DEFAULT: empty

MBX overrides normal monitor functions so that you can monitor one or both sides of a conversation.
MBX filters the received packet stream so that only packets from the selected stations are shown, without headers, codes, or repeated frames. Permits you to read and record data without having to log on or connect to the source station.
Use this command if someone is dumping a file on a PBBS, any you would like a clean copy of it.
The resulting information is free of all headers, frame identifier codes, repeats and improperly sequenced lines.
"ALL" permitts MBX to monitor packets from any station.
MBX is cleared with %, &, N, or NO.

MCON 'n' DEFAULT: 0 (zero)

Allows selective monitoring of a other traffic while connected to a distant station. Affects the display only in the connected state.
'n' = 0 to 6 signifying various levels of monitoring
0 = Disable monitoring while connected.
1 = Show only unnumbered (UI) frames resulting from an unconnected transmission. Also displays beacons.
2 = Numbered (I) frames are also displayed. These result from a connected transmission. Monitors connected conversations in progress.
3 = Connect requests (SABM or 'C') frames and (DISC or 'D') frames are also displayed with headers.
4 = Unnumbered acknowledgment frames (UA) of connect and disconnect state frames are also displayed with either the character (UA) or (DM) and a header.
5 = Receive Ready (RR), Receive Not Ready (RNR), Reject (RJ) Frame Reject (FRMR) and (I)- frames are also displayed.
6 - Poll/Final bit and sequence numbers are also displayed.

MDCHECK

Logs you on to your own mailbox to check for messages.
While you are logged onto the mailbox, any connect request from a distant station will be answered with a "BUSY" (DM) frame to the distant station.
If MAILDROP is OFF, you cannot issue mailbox commands.
You must use the MDCHECK command .
A blinking STA LED indicates that a message has been left for the mailbox owner. MDCHECK turns off the STA LED.
You cannot log onto your mailbox while a connect with another station is in progress.

MDIGI (ON/OFF) DEFAULT: OFF

Permits you to display packet frames that your monitor would normally not show when another station uses your station as a digipeater.

ON - I and UI frames having your call sign (MYCALL or MYALIAS) as the next digipeater in the digipeater field are displayed.

OFF - Normal monitoring as determined by the monitoring mode commands.

MDMON ON/OFF DEFAULT: ON

ON - Monitors a calling station's activity on your mailbox.

OFF - Normal monitoring as determined by the monitoring mode commands.

MDPROMPT text

text = any combination of characters and spaces up to a maximum of 80 bytes.

MDPROMPT is the command line sent to a calling station by your mailbox in response to a send command issued by the user.

DEFAULT: "Enter message, ^Z (CTRL-Z) to end".

MFILTER n1 ['n2 [,n3 [,n4]]] DEFAULT: $80

Selects characters fo be filtered or excluded from the monitored packets.

'n' = $00 to $80 (0 to 128 decimal) specifies an ASCII character code. Up to 4 characters can be specified.

MFROM ALL/NONE or YES/NO call1 [,call2..] DEFAULT: ALL

Determines how the PK232 monitors the packet channels, and displays the information. Determines which station's packets will be displayed, and which station's packets will be hidden.

MFROM NONE Stops any packets from being displayed.

MFROM YES [call list] displays packets only from stations whose call is in list.

MFOM NO [call list] Hides or masks packets from one or more specific stations.

Clear MFROM with %, & or OFF.

MHEARD

Displays a list of stations heard since the last time the MHEARD buffer was cleared.

To clear MHEARD buffer use MHEARD &, N, NO, NONE, or OFF.

The maximum number of stations that can be logged is 18.
As more stations are heard, earlier entrys are discarded.

MID 'n'

n = 0 to 250 Specifies the Morse ID timing in 10 second intervals. PK232 issues a 20 WPM Morse ID.
n = 0 Disables Morse ID (DEFAULT)

If HID is ON, ID will cause HDLC ID to be transmitted immediately (same as before).
If MID is set to a value other than 0, ID will force a MORSE ID immediately. If both HID and MID are active, the MORSE ID will be sent first.

MONITOR 'n' DEFAULT: 4

'n' = 0 to 6 determines various levels on monitor indications.

0 = Disable monitoring while connected.
1 = Show only unnumbered (UI) frames resulting from an unconnected transmission. Also displays beacons.
2 = Numbered (I) frames are also displayed. These result from a connected transmission. Monitors connected conversations in progress.
3 = Connect requests (SABM or 'C') frames and (DISC or 'D') frames are also displayed with headers.
4 = Unnumbered acknowledgment frames (UA) of connect and disconnect state frames are also displayed with either the character (UA) or (DM) and a header.
5 = Receive Ready (RR), Receive Not Ready (RNR), Reject (RJ) Frame Reject (FRMR) and (I)- frames are also displayed.
6 - Poll/Final bit and sequence numbers are also displayed.

MPROTO (ON/OFF) DEFAULT: OFF

ON - Monitors all I and UI frames as before.
OFF - Monitors only those I and UI frames with PID byte of $F0.
Used with NET/ROM that sends frames that have a PID of $CF.
Allows monitoring of frames used by NET/ROM.

MRPT (ON/OFF) DEFAULT: ON

Affects the way monitored packets are displayed.
ON - Show digipeaters in the header. Stations heard directly are marked with an "*" asterisk.
OFF - Show packets only from originating and destination stations.

MSTAMP (ON/OFF) DEFAULT: OFF

Activates or disables time stamping of monitored packets.
ON - Monitored frames are time stamped.
OFF - Monitored frames are not time stamped.

MTO ALL/NONE or YES/NO call1 [,call2...] DEFAULT:none

MTO determines how the PK232 monitors the packet channel.
It determines which station's packets will be displayed,
and which station's packets will be masked off or hidden.
MTO ALL Stops all packets to all stations from being displayed
MTO YES <call list> will display packets to the stations,
whose calls are included in list.
MTO NO <call list> Packets to stations whose calls are included
in list, will not be displayed.
Clear MTO with %, &, or OFF

MYALIAS call [-n] DEFAULT: Empty

Specifies an alternate callsign or alias for use as a
digipeater only.
n = 0 to 15 optional substation ID.

MYCALL call [-n] DEFAULT: PK232

Loads your call sign into PK232 memory.
n indicates an optional substation id (SSID).
If MYCALL has not been changed from the default value of
"PK232", PK232 will not transmit or acknowledge any
packets. This prevents "PK232" from being transmitted.

PACKET

Causes the PK232 to enter the packet radio mode.

PACLEN 'n' DEFAULT: 128

Sets the maximum number of user data bytes to be carried in
each packet's information field.
'n' = 0 to 255 data bytes or characters.
0 = is equivalent to 256
NOTE: it is not necessary that two TNC's be set to the
same packet length to exchange data. Some TNC's may
not be compatible with frames containing more than
128 data bytes.

PACTIME EVERY|AFTER 'n' DEFAULT: After 10 (1000 ms)

A PACTIME parameter is ALWAYS used in TRANSPARENT mode.
PACTIME is also used in converse mode if CPACTIME is ON.
'n' = 0 to 250 specifies number of 100 millisecond intervals.
EVERY - packet timeout occurs every 'n' * milliseconds.
AFTER - packet timeout occurs when 'n' * 100 milliseconds
elapse without input from the computer or terminal.
A zero length packet will never be produced. The timer
is not started until the first character or byte is entered.
A value of 0 for 'n' is not allowed. Zero means packets are
sent with no wait time.

PASS 'n' DEFAULT: $16 <CTRL-V>

Selects the ASCII character code to be used for the pass input editing command.
'n' = $00 to $7F (0 to 127 decimal) ASCII code.
'n' is the numeric ASCII code for the character you'll use to signal that the character immediately following it is to be included in the packet or text string.

Use the PASS character (DEFAULT: <CTRL-V)) to send characters that usually have special functions.

PASSALL (ON/OFF) DEFAULT: OFF

ON - PK232 will accept packets with invalid CRC's.
OFF - PK232 will accept packets with valid CRC's ONLY.
PASSALL shuts off the error detecting mechanism in packet mode.
When PASSALL is ON, MHEARD logging is disabled since the call signs detected may be incorrect.

PERSIST 'n' DEFAULT: 127 (middle between 0 and 255)

'n' = 0 to 255 specifies the threshold value for a random number attempt to transmit.
'n' = 0 Signifies a 1/256th chance of transmitting erery SLOTTIME.
'n' = 255 Signifies 'transmit right away without delay'
When PK232 has data ready for transmission, the PK232 watches the DCD signal from it's internal modem. The PK232 waits forever for the DCD signal to go to the inactive state. When DCD goes inactive, meaning that the channel is clear, the PK232 generates a random number between 0 and 255. If the random number is equal to or less than PERSIST, PK232 keys the PTT line, waits .01 * TXDELAY seconds, and then transmits all frames in it's queue.
If the random number generated is greater than PERSIST, the PK232 waits .01 * SLOTTIME seconds and repeats the procedure. If DCD has gone active in the meantime, the PK232 again waits for DCD to go inactive before it continues.

PPERSIST (ON/OFF) DEFAULT: OFF

ON - PK232 uses the PERSIST and SLOTTIME parameters in executing p-persistent CSMA (Carrier Sense Multiple Access).
OFF - PK232 uses DWAIT for TAPR-type 1-persistent CSMA.

RELINK (ON/OFF) DEFAULT: OFF

ON - PK232 will automatically try to reconnect the distant
station after the link has timed out on retries.
OFF - PK232 will not attempt to re-establish the failed link.
Set RELINK to OFF when using the PK232 with host computer
applications.

RESPTIME 'n' DEFAULT: 10 (1000 ms)
'n' = 0 to 250 100 ms intervals.
Adds a minimum delay before the PK232 sends acknowledgement
packets.

RETRY 'n' DEFAULT: 10
'n' = 0 to 15 specifies the maximum number of packet retrys.
'n' = 0 specifies an infinite number of retrys.
FRACK specifies the time between retrys.

SENDPAC 'n' DEFAULT: $0D <CTRL-M>
'n' = $00 to $7F (0 to 127 decimal) ASCII character code.
Selects the character used to force a packet to be sent
in converse mode.
Use SENDPAC $0D with CR ON to send packets with <CR> included
in the packet.
If CAPTIME ON, set SENDPAC to a value not ordinarily used,
(for example <CTRL-A> with CR OFF). This setting forces
packets to be sent without extra <CR> characters in the text.

SLOTTIME 'n' DEFAULT: 10 (100 seconds)
'n' = 0 to 250 specifies the time interval during which
the PK232 waits between generating random
numbers, to see if it can transmit.

SQUELCH (ON/OFF) DEFAULT: OFF
ON - PK232 responds to positive going squelch voltage.
OFF - PK232 responds to negative going squelch voltage.
PK232 normally senses audio mark and space tones from
the receiver as an indication that the channel is busy.
If there are voice signals on the channel, the PK232 may
not accept them as an indication that the channel is
busy, and double with them. In this case, the squelch
voltage from the radio can be fed into the PK232 to provide
a positive means of determining if the channel is busy or
not. SQUELCH permits either polarity of radio squelch
voltage to be used.

TRANS

Switches PK232 from command mode to TRANSPARENT mode.
The current state of the radio link is not affected.
TRANSPARENT mode is used to transfer binary or other
non-text files.

TRIES 'n' DEFAULT: 0

'n' = 0 to 15 specifies the current RETRY level on the selected input channel.

TRIES retrieves (or forces) the count of tries on the data channel presently selected.

TRIES <with no argument> returns the current number of tries if an outstanding unacknowledged frame exists. If no outstanding unacknowledged frame exists, PK232 returns the number of tries required to get an ACK for the previous frame.

TRIES is used to gather statistics on a given path or channel.

TRIES 'n' forces the tries counter to the entered value. (This method is not recommended to force a new count into the TRIES counter).

TXDELAY 'n' DEFAULT: 30 (300 ms)

'n' = 0 to 120 ten millisecond intervals.

Tells PK232 how long to wait before sending packet frame data after keying your transmitter's PTT line.

TXFLOW (ON/OFF) DEFAULT: OFF

ON - Software flow control for Pk232 can be activated in the Transparent mode.

OFF - Software flow control for PK232 is disabled in Transparent mode.

If TXFLOW is ON, the settings of XFLOW determine the type of flow control used in Transparent mode.

If TXFLOW is OFF, PK232 uses only hardware flow control; all data sent to the terminal remains fully transparent.

If TXFLOW and XFLOW are ON, PK232 uses the START and STOP characters (set by XON and XOFF) to control the input from the terminal.

Unless TRFLOW is also on, only hardware flow control is available to the computer or terminal to control output from the PK232.

If START and STOP characters are set to $00, hardware flow control is always selected, regardless of the setting of TXFLOW.

UNPROTO call1 [via call2 [,call3....,call9]] DEFAULT:CQ

Sets the digipeat and destination address fields of packets sent in the unconnected (unprotocol) mode.

call1 - call sign to be placed in the TO address field.
call2-9 - Optional digipeater call list (up to 8 calls).
Unconnected packets are sent as unsequenced I frames with the destination and digipeat fields taken from call1 through call9 options.

USERS 'n' DEFAULT: 1
'n' = 0 to 10 specifies the number of active simultaneous connections that can be established with your pk232.
USERS only affects the way INCOMING connect requests are handled. It does not affect the number of connections that you initiate.

VHF (ON/OFF) DEFAULT: ON
ON - Packet modem tones are shifted 1000 Hz.
OFF - Packet tones are shifted 200 Hz.
ON is for VHF Packet operation.
OFF is for HF Packet operation.

WHYNOT ON/OFF (DEFAULT OFF)
ON - PK232 will generate a reason why a received packet was not displayed on the screen.
OFF - This function is disabled.
----------- Reasons for Bad Packets ----------
Bit Residue - Frame ended in the middle of a byte.
Passall - Received packet frame had errors and PASSALL was set to off preventing the packet from being displayed.
DCD Threshold - The Threshold control was set to far CCW. The DCD LED was off when the packet was received.
MONITOR - The MONITOR value was set too low to receive this type of frame.
MCON - MCON was set too low to receive this type of frame.
MPROTO - MPROTO was set to OFF and the received packet was probably a NET/ROM or TCP/IP frame.
MFROM/MTO - The frame was blocked by the setting of either MFROM or MTO commands.
MBX - The call sign of the sending station does not match the callsign setting in the MBX command.
MBX SEQUENCE - The packet frame has been received out of sequence indicating that it is probably a "retry".
FRAME TOO LONG - Incoming packet frame is longer than 330 bytes. Probably a non-AX.25 frame.
FRAME TOO SHORT - Incoming packet frame is shorter

than 15 bytes. Only seen if PASSALL
is set to ON. Probably a non-AX.25
frame.

RX OVERRUN - Another HDLC byte was received before
the previous one could be read from
the HDLC chip (8530).

XMITOK (ON/OFF) DEFAULT: ON
ON - Transmit functions (PTT Line) are active.
OFF - Transmit functions (PTT Line) are disabled.
If XMITOK is OFF, the PTT line to the transmitter is disabled.
All other pk232 functions remain the same.
XMITOK is set to OFF when you want to monitor channel
activity without ever transmitting.

Subject: PK232 Command List (Part 1)
Message-ID: <Ic7gFm600WBMA1HUgE@andrew.cmu.edu>
Date: 1 May 91 13:36:50 GMT
Organization: Computing Systems, Carnegie Mellon, Pittsburgh, PA
Lines: 637

My first posting of the PK232 Command List (in uuencoded format)
looks like it got trashed. I received numerous requests for a mailing
of the ASCII version, so I am posting the ASCII in 4 parts. This posting
contains PART 1. Combine the parts as you see fit. Please feel free
to upload the file to local packet BBS's or USENET sites where it will
be available to PK232 owners.

\paul
WA3TLD

PK232CMD.LST PART 1

The following information was obtained from the AEA PK232 Operations Manual,
the PK232 Technical Reference Manual, and the various updates that were
supplied with firmware upgrades. The reason for compiling this listing was my
need to have one combined reference for the entire PK232 command set in
electronic form which could be searched or read from within a terminal
program. The PK232 command listing is plain vanilla ASCII with no hidden

control codes or formatting instructions. I have contacted AEA, and they have given me permission to release this information in electronic form, provided that it is placed into the public domain and not sold. There is no information in this listing that cannot be obtained from one of the AEA documents or manuals for the PK232; this listing just makes it a little easier to search/find info on particular PK232 commands options etc. I have made reasonable effort to insure that the information contained in the listing is correct and accurate. I DONNN'TT Makee Mastakes. If you find one, PLEASE send your correction to:

pauld@fs1.ece.cmu.edu
or
paul+@andrew.cmu.edu
or
WA3TLD @ NO3M.#WPA.PA.USA.NA

Enjoy!

==========

PK232 COMMAND SUMMARY
(Version 1.0 4-30-91)

========== MULTIMODE COMMANDS ==========

AAB text Default: empty
Modes: Baudot, Ascii, Amtor
text = any ascii text up to 17 characters.
AAB sends "text" automatically in response to a "WRU" command from the distant station.

ACRDISP 'n' DEFAULT: 80
MODES: ALL
'n' = 0 to 255
'n' specifies the screen or printer width (in columns).
'0' disables this function.
After 'n' characters have been printed, the PK232 sends a <CR><LF> sequence to the computer or terminal.
For MORSE Mode: Received data will be broken up into word boundries if possible. PK232 generates a <CR> when the first space is received after column X. If ALFDISP is also on, PK232 also generates a <LF>.
Column X is 12 less than the ACRDISP value. If ACRDISP is set to 0, then column X = 60.

ACRRTTY 'n' DEFAULT: 71 (69 in AMTOR)
MODES: Baudot, Ascii Rtty
'n' = 0 to 255
'n' specifies the number of characters on a line, after which, a <CR> is automatically inserted in the transmitted text.
'0' disables this function

AFILTER (ON/OFF) DEFAULT: OFF
MODES: ALL
ON - The ASCII characters specified by MFILTER are filtered out and never sent to the terminal or computer.
OFF - Characters specified by MFILTER are only filtered from monitored packets.
If ECHO is ON, and the terminal or computer sends a filtered character, the PK232 WILL echo it back to the computer or terminal.
CAUTION: AFILTER must be OFF for binary file transfers.

ALFDISP (ON/OFF) DEFAULT: ON
MODES: All
ON - A line feed <LF> character is sent to the terminal after each carrage return <CR> character. Each line feed received is ignored.
OFF - A <LF> is not sent to the terminal after each <CR>
Affects the local display only, and does not affect the data transmitted in any mode. Affects received packets as well as text typed in.

ALFRTTY (ON/OFF) DEFAULT: ON
MODES: Baudot, Ascii Rtty
ON - A <LF> character is sent after each <CR> character.
OFF - A <LF> is not sent after each <CR>

AWLEN 'n' DEFAULT: 7
MODES: All
'n' = 7 or 8
'n' = number of data bits per word
The 'RESTART' command must be issued before a change in word length will take effect.

BKONDEL (ON/OFF) DEFAULT: ON
MODES: All
Determines how character deletion is displayed in command

or Converse modes.
ON - The sequence <BACKSPACE><SPACE><BACKSPACE> is echoed when a character is deleted from the input line.
OFF - The <BACKSLASH> <\> character is echoed when a character is deleted from the input line.
Set to 'ON' for video terminals or computers.
Set to 'OFF' for printers.

CALIBRATE
Starts the modem calibration routine.
PK232 shows on screen display of AFSK generator tone frequencies (in Hz). The frequency and calibration pot number associated with that tone are displayed.
Commands:
K - Toggles transmitter PTT line on and off.
Q - Quits the calibration routine.
H - Toggles the transmitted audio tones between wide shift (1000 hz), and narrow shift (200 hz).
SPACE> - Toggles the transmitted audio tone between MARK (low tone), and SPACE (high tone).
D - Alternates the transmitted mark and space tones at a rate set by the radio (HB) baud rate.
'D OFF' transmits a continuous mark or space tone.

CANLINE 'n' DEFAULT: $18 <CTRL-X>
MODE: All
'n' = $00 to $7F (0 to 127 decimal)
'n' specifies an ASCII character code.
Sets the CANCEL-LINE input editing command character.
When CANLINE is used, the current line is terminated with a <\>, and a new command prompt appears.

CCITT (ON/OFF) DEFAULT: ON
MODE: Baudot Rtty.
ON - Characters typed or loaded from disk are translated into CCITT International Telegraph Alphabet #2 before being sent.
OFF - Characters sent to PK232 are not translated, but remain in the American standard Baudot format (Typically Western Union).

CODE n DEFAULT: 0
MODES: Baudot, AMTOR, MORSE
n = 0 to 5 specifies a code to use.

CODE	Meaning	MORSE	BAUDOT	AMTOR
0	International	RX/TX	RX/TX	RX/TX
1	U.S Teleprinter	-	RX/TX	-

2	Cyrillic	RX	RX	RX
3	Transliterated Cyrillic	RX	RX	RX
4	Katakana	RX/TX	-	-
5	Transliterated Katakana	RX	-	-

(See pages N-4 - N-7 for more details concerning codes)

COMMAND 'n' DEFAULT: $03 <CTRL-C>

MODES: All

Used to change the command mode entry character.

'n' = $00 to $7F (0 to 127 decimal)

'n' specifies an ASCII character code.

CONVERSE

MODES: All

Causes the PK232 to switch from command mode to converse mode.

Link connections in packet and AMTOR are not affected.

CRADD (ON/OFF) DEFAULT: OFF

MODES: Baudot Rtty

Permits you to setup the PK232's newline sequence so that an additional carrage return as added automatically at the end of each typed line.

ON - Send <CR CR LF> in Baudot Rtty

OFF - Send <CR LF> in Baudot Rtty

The double CR is required in some rtty services such as in MARS operation.

CWID 'n' DEFAULT: $06 <CTRL-F>

MODES: Baudot/ASCII Rtty/AMTOR

Lets you change the 'send cwid' control character, typed at the end of a Baudot or ASCII Rtty or AMTOR keyboard diaglog, or text file stored on disk.

When character 'n' is seen by the PK232, it switches to CW mode, and sends your call sign at the speed set by MSPEED.

After call sign has been sent, PK232 returns to Baudot or ASCII Rtty receive, in command mode.

CWID ON Activates this function.

CWID OFF deactivates the function.

DAYTIME date&time DEFAULT: Not set

MODES: All
Sets the PK232 internal clock to the current date and time.
Format for entering date and time:

DAYTIME YYMMDDhhmm
(year, month, day, hour, minute)

All codes must have 2 digits. For numbers 0-9 add leading zeros.
If DAYTIME has not been set, and a <CTRL-T> is pressed, PK232 sends an <*>.

DAYSTAMP (ON/OFF) DEFAULT: OFF
MODES: All
Activates the date in CONSTAMP and MSTAMP.
ON - The date is included in CONSTAMP AND MSTAMP
OFF - Only the time is includes in CONSTAMP and MSTAMP

DCDCONN (ON/OFF) DEFAULT:OFF
MODES: Packet and AMTOR
Defines how the DCD (Data Carrier Detect) signal affects pin 8 of the RS-232 interface.
ON - RS-232 cable pin 8 follows the state of the CON LED.
OFF - RS-232 cable pin 8 is permanently set high (active)

DELETE (ON/OFF) DEFAULT: OFF
MODES: All
Selects the key to use for deleting while editing.
ON - <DELETE> ($7F) key is used for deleting text.
OFF - <BACKSPACE> ($08) is used for deleting text.
BKONDEL command controls how the PK232 indicates deletion.
You cannot use the DEL key to delete text before the beginning of a line.
Use the PASS character to delete <CR> characters that have been typed into the text.
To see a corrected display of the edited line, use the redisplay-line character which is set by the REDISPLAY command.

DIDDLE ON/OFF (DEFAULT OFF)
MODES: Baudot, ASCII
ON - In Baudot, PK232 sends LTRS character while idling.
In ASCII, PK232 sends NULL ($00) while idling.
OFF - No characters are sent while idling in transmit.

DISPLAY [class]
MODES: Command Mode
'class' can be one of the following:

(A)sync Display asynchronous port parameters.
(C)character Display special characters.
(F)ax Display Facsimile parameters.
(I)d Display ID parameters.
(L)ink Display Link parameters.
(M)onitor Display monitor parameters.
(R)tty Display Baudot/ASCII/RTTY, AMTOR and MORSE parameters.
(T)iming Display timing parameters.
(Z) Display the entire command parameter list.

EAS (ON/OFF) DEFAULT: OFF
MODES: Baudot, ASCII Rtty, AMTOR and MORSE
ECHO AS SENT functions in all modes except PACKET.
ON - Display characters as actually sent on the air by PK232.
OFF - Display characters as sent to the PK232 by the computer.

If EAS is ON, only upper case characters will be displayed, representing the actual data sent to the distant station.
For AMTOR Mode A (ARQ) - If EAS is ON, characters are displayed on the screen ONLY after they are Ack'd by the distant station, no matter how fast you type, (3 at a time).
Nulls ($00) are not echoed.

ECHO (ON/OFF) DEFAULT: ON
MODES: All
Controls local echoing by the PK232 when it is in command or converse mode. Local echoing is disabled in TRANSPARENT mode.
ON - Characters received from the computer ARE echoed by the PK232.
OFF - Characters are not echoed.

ESCAPE (ON/OFF) DEFAULT: OFF
MODES: ALL
Selects the character to be output when an <ESCAPE> character is to be sent to the terminal.
ON - The <ESCAPE> character, ($1B) is output as "$" ($24)
OFF - The <ESCAPE> character is output as <ESCAPE> ($1B)

FLOW (ON/OFF)   DEFAULT: ON
MODES: All
ON - Flow control is active. Any character typed on the keyboard causes output from the PK232 to the terminal to stop until any of the following conditions exist:

1. A packet is forced in CONVERSE mode.
2. A line is completed in COMMAND mode.
3. The packet length (PACLEN) is exceeded.
4. The terminal output buffer fills up.

OFF - Type in flow control is NOT active.

FULLDUP (ON/OFF)   DEFAULT: OFF
MODES: ALL
ON - Full Duplex mode is ENABLED.
OFF - Full Duplex mode is DISABLED.
When full duplex is DISABLED, the PK232 uses the DCD (data carrier detect) signal from it's modem to avoid collisions. PK232 acknowledges multiple packets in a single transmission with a single acknowledgment.
When full duplex is ENABLED, PK232 ignores the DCD signal, and acknowledges packets individually.

HELP
MODES: ALL
Displays the more important PK232 commands.

HEREIS 'n'   DEFAULT: $02 (CTRL-B)
MODES: BAUDOT, ASCII, AMTOR
n = hexidecimal representation ($01-$7F) that causes the AAB string to be sent in the middle of transmitted text.

HOST (ON/OFF)   DEFAULT: OFF
MODES: ALL
Puts PK232 in 'host mode'.
ON - PK232 goes into HOST mode.
OFF - PK232 operates as a normal TNC.
To exit host mode, send: 3 <CTRL-C> characters or type <CTRL-A> O H O N <CTRL-W>
Sending a BRK signal will not exit PK232 from host mode.
Turning the PK232 on or doing a RESTART command while in HOST mode causes the TNC to issue a RESTART response ($01 $4F R T $00 $17)

LOCK

MODES: MORSE/Baudot/AMTOR/FAX
Instructs the PK232 to measure the speed of the received MORSE code signals, and lock it's timing to the speed of the incoming signals. LOCK also forces LETTERS shift in Baudot and AMTOR modes.

MFILTER n1 [,n2 [,n3 [,n4]]]] DEFAULT: $80

MODES: MORSE/Baudot/ASCII/AMTOR/PACKET
n = $00 to $80 (0 to 128 decimal)
n specifies an ASCII character code.
Up to 4 characters may be specified.
n = $80 (Special Value) - All characters in the range $80 to $FF, as well as control characters , except for <CR> ($0D), Linefeed <LF> ($0A), and TAB ($09), are filtered out and not sent to the terminal or computer.

MARSDISP (ON/OFF) DEFAULT: OFF

MODES: Baudot and AMTOR RTTY.
Permits the operator to detect and display every character, including LTRS and FIGS codes sent by the other station. ACRDISP and ALFDISP can be turned off to prevent carrage returns and line-feeds from being sent to the RS-232 port.
ON - PK232 translates LTRS character to a <CNTRL-O> and FIGS character to a <CTRL-N> and sends these to the terminal.
OFF - PK232 does not display LTRS and FIGS codes.

MWEIGHT 'n' (DEFAULT: 10)

MODES: ALL except PACKET
n = 5 to 15 Specifies the ratio of dot length to inter-element space length.
n = 10 results in a 1:1 dot space ratio.
n = 5 results in a .5:1 dot space ratio.
n = 15 results in a 1.5:1 dot space ratio.
MWEIGHT applies to MORSE mode, and to the CW id's of all other modes EXCEPT PACKET.

NEWMODE (ON/OFF) DEFAULT: ON

MODES: ALL
Determines how the Pk232 behaves when the link is broken.

ON - PK232 returns to command mode upon disconnect.
OFF - PK232 does not return to command mode upon disconnect.

NOMODE (ON/OFF) DEFAULT: OFF
MODES: ALL
ON - NEWMODE function is ignored, OK232 switch mode commands work only upon explicit command.
OFF - PK232 changes mode according to NEWMODE.

NUCR (ON/OFF) DEFAULT: OFF
MODES: All
Causes the PK232 to send <NULL> characters ASCII ($00), to the computer or terminal. This function permits the PK232 to be used with a Teletype machine or other mechanical type of terminal that requires a time delay after a <CR> is sent from the PK232. The time delay gives the mechanical carrage time to return to the home position.
ON - <NULL> characters are sent to the terminal following a <CR> character.
OFF - <NULL> characters are not sent to the terminal following a <CR> character
The NULLS command sets the number of individual nulls to be sent for the NUCR command.

NULF DEFAULT: OFF
MODES: ALL
ON - <NULL> characters are sent to the terminal following a <LF> character.
OFF - <NULL> characters are NOT sent to the terminal following a <LF> character.
This command sends the <NULL> character ($00) to the terminal or computer after every <LF> character.
This function permits the PK232 to be used with a Teletype machine or other mechanical type of terminal that requires a time delay after a <LF> is sent from the PK232. The time delay gives the mechanical carrage time to perform a line feed.
The NULLS command sets the number of null character that will be sent after each <LF> character.

NULLS 'n' DEFAULT: 0 (zero)

MODES: All
Specifies the number of <NULL> characters ($00) that will be sent to the terminal after a <CR> or <LF> is sent.
'n' = 0 to 30 number of nulls to be sent.
Nulls are sent from the PK232 to the terminal only during converse and command modes.

NUMS

MODES: Baudot, AMTOR
Forces PK232 into Figures case in Baudot and AMTOR receive.

OPMODE

MODES: ALL
Shows the current PK232 mode of operation and system status.

PARITY 'n' DEFAULT: 3 (even)

MODES: ALL
'n' = 0 to 3 selects a parity option.
0 = no parity
1 = odd parity
2 = no parity
3 = even parity

The parity bit is stripped automatically on input and is not checked in command and converse modes.
In TRANSPARENT mode, all 8 bits, including parity, are transmitted in packets. When no parity is selected, and AWLEN is 7, the 8th bit is sent as a "0".

PROUT (ON/OFF) DEFAULT: OFF

ON - All text characters, including terminal echoes, are sent to the parallel printer if PRCON is also ON.
Keyboard input is still accepted.
OFF - All text and data is sent to the terminal through the serial port.
This command is useful when using a dumb terminal with the PK232 for getting a hard printed copy of what is being received by the PK232.

RCVE

MODES: Baudot and ASCII Rtty
Switches PK232 from transmit to receive, when used in the command mode.
(CTRL-C enters the command mode)

RECEIVE 'n' DEFAULT: $04 <CTRL-D>
MODES: Baudot/ASCII/MORSE/AMTOR
'n' = 0 to $7F (0 to 127 decimal)
'n' specifies an ASCII character code
The RECEIVE command let's you specify a character that can be inserted in your typed text or disk file. When this character is read by the PK232, PK232 switches from transmit to receive, and returns to command mode.

REDISPLA 'n' DEFAULT: $12 <CTRL-R>
MODES: All
'n' = $00 to $7F (0 to 127 decimal)
'n' is the ASCII code for the character you'll use to re-display the current input line.
REDISPLA causes the line you just typed to be re-displayed.

RESET
MODES: ALL
Resets all parameters in the PK232 to default prom settings.
All personalized parameters are LOST.
RESTART will reinitialize the PK232 from battery backed up ram, keeping all the user personalized parameters.

RESTART
MODES: ALL
Reinitializes the PK232 using the defaults stored in the battery backed up ram. RESTART has the same effect as turning the PK232 off then back on.

RXREV (ON/OFF) DEFAULT: OFF
MODES: Baudot/ASCII/AMTOR
ON - Received data polarity is reversed (mark-space reversal).
OFF - Received data polarity is normal.

Type "RXREV TOG" to toggle the polarity of the received
signal when trying to decode an unknown Baudot signal.

SIGNAL

MODES: ASCII/AMTOR/BAUDOT
Causes Pk232 to enter the SIAM Signal Analysis mode.
After about 10 seconds, the screen will display the predicted
signal type and confidance factor.
The signal type can be ASCII, AMTOR, ALIST, Baudot,
synchronous, noise, 6-bit.
The confidance factor ranges from 0.1 to 0.99.

START 'n' DEFAULT: $11 <CTRL-Q>

MODES: ALL
'n' = $00 to $7F (0 to 127 decimal)
'n' specifies an ASCII code for the User Start character
that you want to use to restart the output from the
PK232 to the terminal, after it has been halted by
the User Stop character.
STOP sets the User Stop character.
If User START or User STOP characters are $00, then
software flow control to the PK232 is disabled.
PK232 will then respond only to hardware flow control,
(CTS). If the same character is used for both START and
STOP character, then the PK232 toggles between start
and stop when the character is read.

Newsgroups: rec.radio.amateur.packet
Subject: PK232 Command List (Part 4 of 4)
Message-ID: <8c7gW8u00WBMM1HWw4@andrew.cmu.edu>
Date: 1 May 91 13:54:16 GMT
Organization: Computing Systems, Carnegie Mellon, Pittsburgh, PA
Lines: 511

========== MORSE COMMANDS ==========

MORSE
PK232 is switched into Morse code mode.

MSPEED 'n' DEFAULT: 20 WPM
Sets the MORSE code keying speed for the PK232.
'n' = 5 to 99 WPM
For speeds between 5 and 14 WPM, code is sent with Farnsworth spacing - the characters are actually sent at 15 WPM.

========== BAUDOT COMMANDS ==========

BAUDOT
Switches PK232 into Baudot Rtty mode.

BITINV n DEFAULT: $00
MODE: Baudot RTTY
n = $00 to $1F (0 to 31 decimal) specifies a number to be exclusive ORed with every received Baudot character.
$00 = no bit imversion, print plain text.

CCITT (ON/OFF) DEFAULT: ON
MODE: Baudot RTTY
ON - If code is 0, PK232 uses the CCITT ITA #2 code in Baudot.
OFF - If code is 0, PK232 uses the U.S. Teleprinter code in Baudot.
CCITT has been replaced with the CODE command, but is retained for compatibility reasons.

RBAUD 'n' DEFAULT: 45 bauds (60 WPM)
'n' specifies the RADIO baud rate for Baudot RTTY.
'n' can be 45, 50, 57, 75, 100, 110, 150, 200, 300 bauds.

USOS (ON/OFF) DEFAULT: OFF
ON - Letters (LTRS) case is forced after a space character.
OFF - Letters (LTRS) case is NOT forced after a space.

========== AMTOR/FEC COMMANDS ==========

ACHG
Forces a changeover from receive to transmit in the AMTOR link.

ADELAY 'n' DEFAULT: 4
'n' = 1 to 9
'n' specifies transmitter key up delay in ten millisecond intervals.
ADELAY is the time between the instant the PTT line is activated for xmit, and the instant when ARQ data actually begins to flow to the transmitter.

ALIST
Switches PK232 into ARQ listen mode. (Mode L).

AMTOR
Switches PK232 into ARQ standby/receive mode.
Any FEC (Mode B) transmissions will be displayed.

ARQ aaaa
Starts a Mode A SELCAL to a distant station.
aaaa = the distant station's selective calling code.

ARQTMO 'n' DEFAULT: 60
'n' = 0 to 250
'n' = number of seconds to send an ARQ selcal before automatic transmitter shutdown.

FEC Puts PK232 in AMTOR Mode B.
Use this mode to send an AMTOR CQ.
Include your SELCAL in your transmitted FEC message so that other stations can call you in Mode A (ARQ).

MYALTCAL aaaa DEFAULT: Empty
aaaa specifies an Alternate SELCAL code.
aaaa can be any 4 alphabetical characters or numeric strings of either 4 or 5 characters.

MYSELCAL aaaa DEFAULT: empty
Specifies your selective calling code (SELCAL)
SELCAL must be specified before you can use AMTOR mode.
Rules for determining your SELCAL:

Group	Call	Selcal
1 by 2	W1XX	WWXX
1 by 3	W1XXX	WXXX
2 by 1	AB1X	AABX
2 by 2	AB1XX	ABXX
2 by 3	KA1XXX	KXXX

MYIDENT aaaaaaa DEFAULT: empty
aaaaaaa specifies the user's seven character SELCAL as described in CCIR Rec. 625.
The PK232 now supports 7 character selcal's in AMTOR mode.

RFEC (ON/OFF) DEFAULT: ON
Prevents the reception of all FEC signals while in AMTOR standby mode.
ON - Mode B FEC signals are displayed while in AMTOR standby.
OFF - Mode B FEC signals are not displayed.

SELFEC aaaa DEFAULT: empty
aaaa specifies a distant station's selective calling code (SELCAL).
SELFEC starts a selective FEC (mode Bs) transmission to the specified distant station, when you enter that station's SELCAL code.

SRXALL (ON/OFF) DEFAULT: OFF
Permits the reception of selectively coded inverse FEC signals normally not available for decoding.
ON - Receive all selective (SELFEC) transmissions.
OFF - Receive only SELCAL addressed SELFEC transmissions.

========== TDM COMMANDS ==========

TDBAUD n DEFAULT: 96
n specifies the data rate (speed in bauds) of the TDM signal you are receiving.
n = 0 to 200 but only some of these are legal values.
1-channel: 48, 72, 96 are legal.
2-channel: 86, 96, 100 are legal.
4-channel: 171, 192, 200 are legal.

TDCHAN n DEFAULT: 0
n specifies the TDM channel number.
n selects the data channel to seperate out from the multiplexed TDM signal. n can be 0-3.
1-channel: No effect.
2-channel: 0 and 2 show channel A.
1 and 3 show channel B.
4-channel: 0 shows channel A.
1 shows channel B.
2 shows channel C.
3 shows channel D.

TDM

Selects TDM mode (Moore Code).
Use SIGNAL to check that received signal is really TDM.
If TDM is detected, type "OK".
AMTOR STATUS LED's are as follows:
STBY: Trying to establish bit phasing.
PHASE: Bit phasing established, trying to synchronize on characters.
OVER: Character synchronization established.
TFC: Printable character received.
IDLE: Idling signals received.
RQ: Error character of $00 or $7F received.
ERROR: Other bad character received.

The PHASE LED stays lit if the signal is too weak to achieve synchronization. Use the "R" command to force manual sync. Repeated use of the "R" command causes the bit synchronization to move along by one bit for each "R" command.
"L" forces letters shift as in Baudot mode..
"N" forces figsures shift as in baudot mode.
TRACE ON displays these characters:

| = NULL
* = LTRS
% = FIGS
a = Alpha Idle
b = Beta Idle
r = Signal Repetition

Some TDM Frequencies: 19,101.9 LSB
18,983.6 USB
14.956.7 USB

TDM stations idle most of the time. You may have to monitor a TDM station for an hour or more before any data is received.

========== FAXCIMILE COMMANDS ==========

ASPECT n DEFAULT: 2

Controls the aspect ratio (length to width) of a FAX image.
n = 1 to 6 specifies the number of FAX scan lines that the PK232 prints out, for every 6 lines received.
For most weather charts ASPECT 2 works well.
To stretch the image down the page, use a higher setting for ASPECT such as 4.
The Index Of Cooperation is an International measure of aspec ratio.
The CCITT IOC is:
IOC = (Vertical scan line density) * (horizontal width) / pi
The IEEE ICO is:

IOC = (Vertical scan line density) * (horizontal width)

ASPECT	CCITT IOC (Narrow)	CCITT IOC (WIDE)
1	1100	1788
2	550 (Weather charts 576)	894
3	367 (Wirephotos 352)	596 (Weather charts 576)
4	275 (WEFAX Satellite 288)	447
5	220	358 (Wirephotos 352)
6	183	298 (WEFAX Satellite)

In receive, ASPECT 2 causes the PK232 to sample 2 out of every 6 lines received. ASPECT 4 causes PK232 to sample 4 out of every 6 lines received.
In transmit, ASPECT 2 causes PK232 to send every line 3 times. ASPECT 4 causes PK232 to send even lines twice and odd lines once. When sending from one PK232 to another, it's best to run the same aspect ratio on both pk232's.

DISPLAY (F)ax Displays all FAX related parameters.

FAX
Switches PK232 into Facsimile mode. PK232 starts in FAX standby, waiting to detect sync pulses that start a frame.

FAXNEG (ON/OFF) DEFAULT: OFF
ON - The white and black senses are reversed.
OFF - The white and black senses are normal.
FAXNEG is not the same as RXREV. RXREV inverts the entire signal, including the sync pulses. FAXNEG keeps the sync pulses upright, but inverts the image data only.

FSPEED 'n' DEFAULT: 2 (2 lines/second)
'n' = 0 to 4 selects the FAX horizontal scan rate, in lines per minute.

FSPEED	(Highest print density Usable)	narrow carrage	wide carrage
1	1 line/sec 60 lines/min	275 dpi	169 dpi
2	2 lines/sec 120 lines/min	138 dpi	85 dpi
3	3 lines/sec 180 lines/min	92 dpi	56 dpi
4	4 lines/sec 240 lines/min	69 dpi	42 dpi
0	1.5 lines/sec 90 lines/min	183 dpi	113 dpi

GRAPHICS 'n' DEFAULT: 1 (960 dots)
'n' = 0 to 6 selects the FAX horizontal graphics dot density printed on the printer.
(See dot density Tables on pages M14 and M15 in PK232 manual)

JUSTIFY 'n'

Moves FAX image closer to the edge of the paper.
'n' = 0 to 25 number of 1/2 inches that the FAX image is to be moved closer to the edge of the paper.
If LEFTRITE is ON, JUSTIFY 1 will move the image 1/2 inch to the left.
If LEFTRITE is OFF, JUSTIFY will move the image 'n' half inches to the right.
If the PK232 is allowed to synchronize by itself, JUSTIFY should not be needed.

LEFTRITE (ON/OFF) DEFAULT: ON

ON - The signal is scanned from left to right.
OFF - The signal is scanned from right to left.
LEFTRITE reverses the horizontal scanning direction.
LEFTRITE is useful for printing wirephotos.

LOCK

Tells the PK232 to start printing regardless of whether or not the facsimile sync pulses have been detected.
LOCK is a manual start command for FAX.
Sync pulses consist of of lines of 5% white and 95% black, with the beginning of the white pulse signifying the left edge of the following image.
If you issue a LOCK command to start FAX printing, you will probably need to use JUSTIFY to properly allign the image.

OPMODE FAX STBY RCVE	PK232 is searching for sync pulses to start printing the next image.
OPMODE FAX SYNC RCVE	PK232 has detected the sync pulses, or synchronization has been forced with the LOCK command, and PK232 should be starting to print the next image.
OPMODE FAX STBY SEND	PK232 is idling or sending the 300 Hz motor start tone, before it sends the sync pulses, or that it is sending the 450 Hz stop tone.
OPMODE FAX SYNC SEND	PK232 is sending either sync pulses or image dots. If the computer has not yet sent the image data to the PK232, PK232 will transmit a white tone continuously.

PRCON (ON/OFF) DEFAULT: OFF

Tells the PK232 whether or not a parallel printer is connected via the special "Y" facsimile cable.
ON - A paralle printer is connected to the PK232 via the special FAX "Y" cable. The mode led's are disabled, and may stay lit or flash randomly.
OFF - There is no paralle printer connected, or it is not currently in use. The mode led's are enabled, and correctly show operating mode and status.

PRFAX (ON/OFF) DEFAULT: ON
ON - FAX bit graphics are sent to the parallel printer for immediate printing if PRCON is also ON.
OFF - FAX bit graphics are sent to the terminal via the serial port, using the printer escape codes, as set by PRTYPE and GRAPHICS.
PRFAX should be sent to on if a parallel printer is connected and in use for printing FAX pictures.
If you wish to save the FAX graphics data to disk, set PRFAX OFF and make sure AWLEN is set to 8 to allow 8-bit data to be sent to the serial port.

PRTYPE 'n' DEFAULT: 2 (Epson)
'n' = 0 to 255 specifies a code for the type of dot graphics sequences used by your printer.
(See pg M-19 of PK232 manual for list of PRTYPE codes.)

XMIT TRANSMITS FAX DATA
Keys the radio PTT line and prepares the radio to receive outbound FAX data. PRFAX must be OFF, AWLEN must be 8, and PARITY must be 0.

========== ASCII COMMANDS ==========

ABAUD 'n' DEFAULT: 110 Baud
Specifies data rate from PK232 to radio.
'n' = Baud Rate (45, 50, 57, 100,110, 150, 200, 300, 400, 600, 1200, 2400, 4800, 9600)

ASCII Switches PK232 into Ascii Rtty Mode.

========== SIGNAL (SIAM) COMMANDS ==========

BITINV n DEFAULT: $00
MODE: Baudot RTTY
n = $00 to $1F (0 to 31 decimal) specifies a number to be exclusive ORed with every received Baudot character.
$00 = no bit imversion, print plain text.

CCITT (ON/OFF) DEFAULT: ON
MODE: Baudot RTTY
ON - If code is 0, PK232 uses the CCITT ITA #2 code in Baudot.
OFF - If code is 0, PK232 uses the U.S. Teleprinter code in Baudot.
CCITT has been replaced with the CODE command, but is retained for compatibility reasons.

OK

Accepts a set of parameters found using the SIGNAL command. Changes (or can change) RXREV, RBAUD, ABAUD, and OPMODE to the values found in using the SIGNAL command.

========== NAVTEX MODE ==========

NAVMSG all, none, Yes/No (letters) DEFAULT: All

Determines which type of NAVTEX messages your PK232 will print.
all - print all types of NAVTEX messages.
none - PK232 prints no NAVTEX messages.
Yes (list) - PK232 prints only those types of NAVTEX messages specified by "list".
NO (list) - PK232 prints all NAVTEX messages EXCEPT those specified by "list".
A. Navigational Warnings
B. Meteorological Warnings (Storm Warnings).
C. Ice Reports.
D. Search and Rescue Information.
E. Weather Forecasts.
F. Pilot Service Messages.
G. DECCA System Information.
H. Loran-C System Information.
I. OMEGA Systems Messages.
J. SATNAV System Messages.
K-Z Reserved for future use.
(up to 13 letter types can be monitored or rejected, and letters can be seperated by spaces commas or TABS)
Types A,B and D cannot be excluded, and will always be monitored.
NAVMSG is cleared by %, & or OFF

NAVSTN all, none, Yes/No (letters) DEFAULT: All

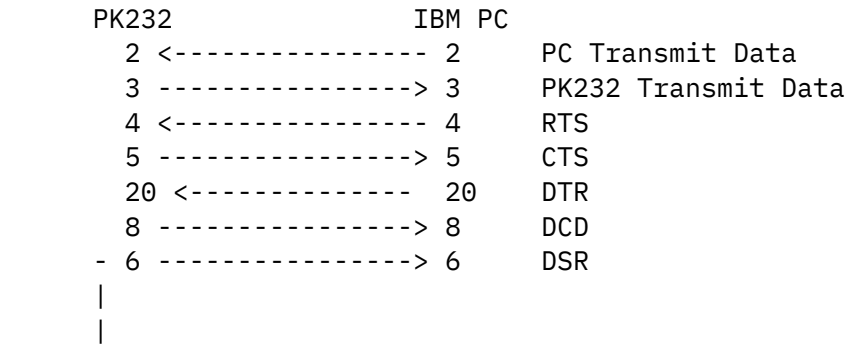
NAVTEX stations are identified by the first letter in the preamble. NAVSTN allows ALL, NONE, or up to 13 letters representing NAVTEX transmitting stations to be monitored or rejected.
Letters in the list can be seperated by spaces, commas or TABS.
NAVSTN is cleared by %, &, or OFF as arguments.

NAVTEX

Switches PK232 into NAVTEX receive mode.
NAVTEX stations are found on 518 Khz.
NAVTEX is a special for of mode B FEC, that does not output data to the computer or printer until "ZCZC" and a preamble are received intact. The preamble consists of 2

letters and 2 numerals. The PK232 will print until the
end-of-message indicator "NNNN" is received.
The first 2 letters define the transmitting station and the
message class respectively.
The following 2 numerals form a serial number that is
remembered by the PK232, when a message is copied intact.
The PK232 remembers the preambles of the last 200 printed
messages, and will not re-print a message with the same
preamble with the following exceptions:
Any message with the preamble 00 is considered an
emergency message, and will always be printed.
Any message with more than 1/8 of it's characters
received in error will not be saved, so that it
may be re-printed.
To clear preamble memory, exit, then re-enter NAVTEX
mode.
NAVTEX mode uses the setting of DAYTIME to print the
date/time in front of the preamble, if MSTAMP and or
DAYSTAMP are ON.

NAVTEX NOTES: Navtex is broadcast in Mode-B AMTOR (SITOR)
on 518 khz.



========== ASYNC PORT PARAMETERS ==========
SYNCING PC to PK232

If PK232 has batteries installed, and a TBAUD baud rate has already
been set, the AUTObaud routine will never come up.
You must match the TBAUD baud rate with the COM port UART baud rate
to communicate with the PK232.

If PK232 does NOT have batteries installed, upon power up, it will
transmit "Please Type * For Autobaud Routine" (at 1200 baud- default).
At this point, you must send ONLY a "*", with no <CR> to sync the
Pk232 with your baud rate. (several *'s may be required).

The PK232 defaults to 1200 baud when TBAUD has never been set, or
at power on, with no batteries installed.

Connection for IBM PC Serial COM Port to PK232

========== SPECIAL CHARACTERS ==========

Hardware Handshake is enabled if XFLOW = OFF.
Other parameters that should be set are:
START = $00
STOP = $00
XON = $00
XOFF = $00

SIGNALS FOR HARDWARE HANDSHAKE

pin	SIGNAL	DIRECTION	SPACE ("0" level/+12V)	MARK ("1" level/-12V)
4	RTS	to PK232	PK232 XMITS DATA	NO DATA TRANSMITTED
20	DTR	to PK232	PK232 XMITS DATA	NO DATA TRANSMITTED
5	CTS	to PC	PC XMITS DATA	NO DATA TRANSMITTED
8	DCD	to PC	ALWAYS +12 VOLTS	
6	DSR	to PC	ALWAYS +12 VOLTS	

NOTE: If DCDCONN is ON, then pin 8 of the RS-232 port "follows"
the PK232 CONNECT led.

I have compiled an ASCII text file which contains all of the PK232MBX
commands and options as of the MBX update. I wanted a file that could
be searched from within a terminal program to get information about
some particular PK232 command without having to drag out the manuals.

Is it legal to post this file, considering that this information
is Copyright by AEA? If it is legal, would anybody out there in netland
be interested in having a copy? File is almost 100K and is plain ASCII
text with no formatting or hidden control characters.

A while ago I did lookups using the server "callbook@sat.datapoint.com"
It worked then, but I don't know if its still up.

Does anyone know if its up?

To lookup a call on datapoint I sent the word lookup followed by the call
in the body of the message. I also included the word path followed by
the path to me from the internet. Also, the word help can be included
to get help. For example:

    >To: callbook@sat.datapoint.com
    >
    >help
    >lookup n6zfx

>path uunet!markets!jeff

From: paul+@andrew.cmu.edu (Paul J. Dujmich)
Newsgroups: rec.radio.amateur.packet
Subject: PK232 Command List (Part 2)
Message-ID: <Uc7gJMu00WBME1HVMR@andrew.cmu.edu>
Date: 1 May 91 13:40:40 GMT
Organization: Computing Systems, Carnegie Mellon, Pittsburgh, PA
Lines: 552

PK232CMD.LST   (PART 2)

STOP 'n' DEFAULT: $13 <CTRL-S>
MODES: ALL
'n' = $00 to $7F (0 to 127 decimal)
"n" specifies an ASCII character code for the User STOP
character. (See explination for START).

TBAUD 'n' DEFAULT: 1200 bauds
MODES: ALL
'n' specifies the PK232 to Computer baud rate.
The baud rate set by TBAUD will take effect upon the next
power-on or RESTART command.
Baud Rates: 45, 50, 57, 75, 100, 110, 150, 200, 300, 400,
600, 1200, 2400, 4800, 9600.

TCLEAR
MODES: ALL
For Baudot/ASCII/AMTOR/MORSE - TCLEAR clears the PK232
transmit buffer and cancels any further

transmission of data.
For PACKET mode - All data is cleared except for a few remaining packets.
TCLEAR must be used from COMMAND MODE.

TIME 'n' DEFAULT: $14 <CTRL-T>
MODES: ALL
'n' = $00 to $7F (0 to 127 decimal)
'n' specifies the control character for embedding the TIME command into your message text or file.
At transmit time, the PK232 reads the embedded control code (default = CTRL-T), reads the time from the PK232 internal clock, and then sends the time to the radio in the data transmission code currently in use at the time.
If DAYSTAMP is ON, the date is transmitted with the time.

TRACE (ON/OFF) DEFAULT: OFF
MODES: PACKET/FAX
ON - Trace function is activated.
OFF - Trace function is disabled.
Activates AX.25 protocol display. When TRACE is ON, all received frames are displayed in their entirety, including all header information. (See pg 6-101 of manual for more details).
If TRACE is ON, PRFAX is OFF and the mode is FAX, the graphics escape sequences and dot data are sent to the terminal with each byte expanded to 2 hexadecimal characters (ascii hex dump). This gets around the limitation of many terminal programs, that do not allow 8-bit data to be saved to disk as an ASCII file. A small program could be used to re-translate the ascii hex back into a binary file. (pg M-29 of Pk232 manual has small IBM Basic program to do this.)

TRFLOW (ON/OFF) DEFAULT: OFF
MODES: ALL
ON - Software flow control for the computer or terminal can be activated in Transparent mode.
OFF - Software flow control for the computer or terminal is disabled in Transparent mode.
If TRFLOW is ON, START and STOP determine the flow control characters to use for software flow control in Transparent mode.

If TRFLOW is OFF, Only hardware flow control is available to the computer, (RTS, CTS). All characters received by the PK232 are transmitted as data.

TXDELAY n DEFAULT: 30

MODES: Packet, Baudot, and ASCII.
n = 0 to 120 ten millisecond intervals.
TXDELAY sets the delay between PTT and and the start of transmitted data. ARQ still uses ADELAY.

TXREV (ON/OFF) DEFAULT: OFF

MODES: Baudot/ASCII/AMTOR
ON - Transmit data polarity is reversed. (mark-space reversal).
OFF - Transmit data polarity is normal.
If TXREV is ON, mark and space are reversed in the AFSK and FSK transmitted signals.

WIDESHFT (ON/OFF) DEFAULT: OFF

MODES: Baudot/ ASCII Rtty
ON - RTTY tones are shifted 1000 Hz.
OFF - RTTY tones are shifted 200 Hz (emulates 170 Hz shift).

WORDOUT (ON/OFF) DEFAULT: OFF

MODES: All modes except PACKET.
Determines whether or not you can edit while entering text for transmission.
ON - Typed characters are held in the transmit buffer until a space character or punctuation is typed.
OFF - Typed characters are sent directly to the transmitter.
The ENQ character ($05) <CTRL-E> will also cause the release of a word, as will space, CR, LF, tab, RECEIVE or CWID character.

WRU (ON/OFF) DEFAULT: OFF

MODES: Baudot/ASCII/AMTOR ARQ
ON - Your answerback is sent after a distant station's WRU?
OFF - Your answerback is not sent after a distant station's WRU?
If WRU is ON, PK232 sends the text in AAB text field.
In AMTOR ARQ, your answerback will automatically send

"+?", the changeover command, to the distant station
to maintain the link.
NOTE: In AMTOR, WRU is ALWAYS ON.

XFLOW (ON/OFF) DEFAULT: ON
MODES: ALL
ON - XON/XOFF software flow control is activated.
OFF - XON/XOFF flow control is disabled. Hardware flow
control is enabled.
If XFLOW is ON, the terminal or computer is expected to
respond to the PK232 START and STOP characters defined by
the XON and XOFF commands.
If XFLOW is OFF, the PK232 sends hardware flow commands
via the RTS hardware line.
For full hardware control in BOTH directions, set START,
STOP, XON, and XOFF to $00.

XOFF 'n' DEFAULT: $13 <CTRL-S>
MODES: ALL
'n' = $00 to $7F (0 to 127 decimal)
Selects the STOP character to be used to stop input from the
computer or terminal.

XON 'n' DEFAULT: $11 <CTRL-Q>
MODES: ALL
'n' = $00 to $7F (0 to 127 decimal)
Selects the PK232 START character that is sent to the
computer or terminal to restart input from that device.

========== PACKET COMMANDS ==========

3RDPARTY ON/OFF DEFAULT:OFF
ON - The Mailbox BBS will handle 3rd party traffic.
OFF - This feature is disabled.

8BITCONV (ON/OFF) DEFAULT: OFF
Permits packet transmission of 8 bit data in Converse Mode.
ON - The high order bit is not stripped in Converse Mode.
Off - The high order bit is stripped in Converse Mode

ACKPRIOR ON/OFF DEFAULT: OFF
ON - Priority acknowledgement is enabled.
When a busy channel condition clears (DCD LED OFF),
DATA Acknowledgements will be sent immediately, while
data and poll bits are held off long enough to prevent

collision with the data acks. ACKS are given priority
so that fewer acks will collide with data from other
stations preventing useless retries.
Digi-peated frames are still sent immediately.
OFF - This feature is disabled.

ACRPACK (ON/OFF) DEFAULT: ON
ON - The send packet character (normally <CR>, is added
to all packets sent in Converse Mode.
OFF - The send packet character is not added to packets.

ALFPACK (ON/OFF) DEFAULT: OFF
ON - A <LF> character is added to outgoing packets following
each <CR> transmitted in the packet.
OFF - A <LF> is not added to outgoing packets.
Affects outgoing packets only, does not affect the local
display.

AUDELAY 'n'
Sets delay between PTT going active, and the start of
transmit AFSK audio tones.
n = 0 to 120 (10 ms intervals).
AUDELAY must always be less than TXDELAY by a setting of 10.

AX25L2V2 (ON/OFF) DEFAULT: ON
ON - PK232 uses AX.25 Level 2 Version 2.0 protocol
OFF - PK232 uses AX.25 Level 2 Version 1.0 protocol

AXDELAY 'n' DEFAULT: 0
'n' = 0 to 180
'n' = specifies a keyup delay for voice repeater operation
in ten-millisecond intervals.
Causes PK232 to wait for a delay period (in addition
to TXDELAY), after keying the transmitter, and before
data is sent.

AXHANG 'n' DEFAULT: 0
'n' = 0 to 20
'n' specifies a voice repeater hang time in 100 mili-second
intervals.

BBSMSGS (ON/OFF) DEFAULT: OFF
ON - Makes the PK232 status messages look like the TAPR
style output.
OFF - The PK232 status messages work as before.

BEACON EVERY|AFTER 'n' DEFAULT: 0

Sets the condition under which the packet beacon will be transmitted.
EVERY - Send the beacon at regular intervals.
AFTER - Send the beacon once after that specified time interval without packet activity.
'n' = 0 to 250
'n' sets beacon timing in ten second intervals.
'0' Turns off the beacon completely.
A beacon frame includes the text you enter with the 'BTEXT' command. The Beacon packet is addressed to 'CQ' or other address specified by 'UNPROTO'.

BTEXT text DEFAULT: Empty
Sets the text portion of the beacon packet.
text = up to 120 characters and spaces.
A multiple line message can be sent by including a <CR> character in the text. <CR> is inserted by typing the PASS character before the <CR>.
The PASS character is sent by the PASS command.
'%', '&', 'N', 'NO', 'NONE', or 'OFF' will clear the BTEXT text.

CANPAC 'n' DEFAULT: $19 <CTRL-Y>
Sets the CANCEL-PACKET input editing command character.
'n' = $00 to $7F (0 to 127 decimal)
'n' specifies an ASCII character code.
Only a packet that is currently being entered can be canceled. When a packet is cancelled, the line is terminated by a <\> and a <NEWLINE>.
The CANCEL-PACKET character also cancels the display output in Command Mode. Type CANCEL-PACKET again to restore the display output.

CASEDISP 'n' DEFAULT: 0 (as is)
Sets the case of the characters that the PK232 sends to the terminal.
'n' = 0 'As is' characters are not changed.
'n' = 1 'lower' characters are displayed in lower case only.
'n' = 2 'UPPER' characters are displayed in upper case only.

CBELL (ON/OFF) DEFAULT: OFF
ON - Three bell characters ($07 CTRL-G) are sent to the terminal with the **** CONNECTED TO, or ****DSCONNECTED FROM messages, when a connection is established, or terminated.
OFF - Bell characters are not sent with the connect message.
CBELL sends bell characters on disconnect as well as connect.

CFROM all, none, yes/no, call1 [call2..] DEFAULT: All
Determines how PK232 responds to connect requests.
call all, none, YES list, NO list

(list up to 8 callsigns seperated by comma's)
CFROM NONE - rejects all connect requests.
CFROM ALL - Accepts all connect requests.
CFROM NO call1, call2, call3 ......
CFROM YES call1, call2, call3 .....
CFROM <%> or <&> or OFF clears the CFROM arguments.

CHCALL (ON/OFF) DEFAULT: OFF
Displays the callsign of the connected-to station after the channel identifier.
ON - Call sign of distant station is displayed in multiple connection operation.
OFF - Call sign of the distant station is not displayed.

CHDOUBLE (ON/OFF) DEFAULT: OFF
Displays received CHSWITCH characters as double characters.
ON - Received CHSWITCH haracters appear twice.
OFF - CHSWITCH characters only appear once.
NOTES: Set CHDOUBLE ON when operating with multiple connections, to tell the difference between CHSWITCH characters received from other stations, and those generated by your PK232.
CHSWITCH character must not be one of the channel numbers (0-9).

CHECK 'n' DEFAULT: 30
Sets a timeout value for a packet connection, and depends on the setting of AX25L2V2.
'n' = 0 to 250 (check time in ten second intervals)
0 = Zero disables this feature.

CHSWITCH 'n' DEFAULT: $00
Selects the characters used by both the PK232 and the user to show that a new connection channel is being addressed.
'n' = $00 to $FF (0-255 decimal)
'n' = ASCII character code.

CMDTIME 'n' DEFAULT: 10 (1000 ms)
Sets the timeout value in TRANSPARENT mode.
A guard time of 'n' seconds is allowed to escape from transparent mode to command mode, while permitting any character to be sent as data.
'n' = 0 to 250 (timeout value in 100 ms intervals)
'n' = 0 Exit from transparent mode requires sending the BREAK signal, or interruption of power to PK232.

CMSG (ON/OFF) DEFAULT: OFF
Enables or disables automatic transmission of the CTEXT message when your PK232 accepts a connect request from another station.
ON = CTEXT message is sent as the first packet after a

connection is established, by a connect request from a distant station.
OFF = The CTEXT message is not sent at all.

CONMODE (CONVERS/TRANS) DEFAULT: CONVERS
Selects the mode that the PK232 uses after entering the connected state.
"CONVERS" = PK232 automatically enters CONVERSE mode after a connection is established.
"TRANS" = PK232 automatically enters TRANSPARENT mode when a connection is established.

CONNECT call1 [VIA call2 [,call3, ...call9]]
Sends a connect request to station at call1, directly, or via one or more digipeaters.
Each call can include an optional SSID 'n' immediately after the callsign.

CONOK (ON/OFF) DEFAULT: ON
An old command related to the TAPR tnc's.
Use CFROM instead of CONOK.
ON - Connect requests from other stations will be accepted if CFROM is set to all.
OFF - Connect requests from other stations will NOT be accepted if CFROM is set to ALL or NONE.

CONPERM (ON/OFF) DEFAULT: OFF
Connect permanantly.
ON - The current connection on the current channel is not allowed to enter the disconnected state.
OFF - The current channel can be connected to and disconnected from other stations.

CONSTAMP (ON/OFF) DEFAULT: OFF
Activates time stamping of ****CONNECTED status messages.
ON - Connect status messages are time stamped.
OFF - Connect status messages are NOT time stamped.

CPACTIME (ON/OFF) DEFAULT: OFF
Activates automatic, periodic transmission of packets while in converse mode.
ON - Packet transmit timer is used in converse mode.
OFF - Packet timer is NOT used in converse mode.
When set to on, characters are transmitted periodically, as they are in transparent mode.
Set ACRPACK OFF for this mode.
CPACTIME ON is a mode similar to full break in CW.
CPATIME ON transmits text soon after it's typed, in short bursts of a few characters. The other station may break in at will.

CSTATUS

Displays the following information:
The number of each logical channel
The link state of all 10 logical channels
The current input/output channel
Whether or not each connection is permanent.

CSTATUS S — CSTATUS short. Displays only those channels which are connected or which are the current input/output channels.

CTEXT "text"

The text message that is sent to another station, as soon as he connect to you.
To type a multiple line CTEXT message, and include a <CR> in the text, use the PASS character <CTRL-V> immediately before the <CR>.
The CTEXT message can be up to 120 characters in length.

CUSTOM 'nnnn'

Specifies a 4 digit hex number, where each bit controlls a different function.
'n' = $00 to $40 (0 to 64).

---------- Bit Descriptions ----------

Bit 0 ($0001) 1 = PK232 discards a received packet if signal is too weak to cause DCD LED to light. (DEFAULT)
0 = Packets will be received regardless of the setting of the threshold control.

Bit 1 ($0002) 0 = (DEFAULT) Setting MONITOR command to a value of "YES" or "ON" results in a MONITOR value of 4.
1 = MONITOR value of "ON" or "YES" forces MONITOR value to 6.

BIT 2 ($0004) 1 = (DEFAULT) A BREAK on the rs232 line puts PK232 into COMMAND Mode.
0 = BREAK on rs232 line does not affect PK232.

BIT 3 ($0008) 0 = (DEFAULT) Packet channel numbers are numbered 0-9.
1 = Packet channel numbers are labeled A-J (lowercase a-j also accepted).

BIT 4 ($0010) 1 = (DEFAULT) PK232 inserts figures shift character after a space prior to sending any figures. <space><FIGS><number>.
0 = PK232 will not insert FIGS character after each space. (Recommended for MARS).

BIT 5 ($0020) 1 = When powered on, PK232 stays in last mode it was in (converse, command or transparent)

0 = (DEFAULT) PK232 always powers up in COMMAND mode.

BIT 6 ($0040) 1 = Monitoring is active in the transparent mode.
0 = (DEFAULT) Monitoring is disabled in the transparent mode.

BITS 7-15 Unused at present time.

CUSTOM "Y" or CUSTOM "ON" returns CUSTOM command to default settings.

DFROM (all, none,yes/no, call1, call1...) DEFAULT: ALL

Determines how the PK232 will be used as a digipeter. It determines which stations will be repeated and which will not be repeated.
NONE - No stations are digipeated
YES (call list) - Packets are digipeated only for those stations whose calls are listed.
NO (call list) - Packets are not digipeated only for those stations whose calls are listed.
%, & or OFF - Clears DFROM.

DIGIPEAT (ON/OFF) DEFAULT: ON

Included for compatibality with TAPR TNC's.
ON - PK232 digipeats packets from all other stations if DFROM is set to ALL.
OFF - PK232 will not digipeat packets if DFROM is set to ALL or NONE.

DISCONNE

Initiates a disconnect command to the distant station to which you are connected. If successfull, the following message appears: **** DISCONNECTED (callsign)

DWAIT 'n' DEFAULT: 16 (160 ms)

Helps to avoid collisions with digipeated packets.
'n' = 0 to 250 ten millisecond intervals.
PK232 pauses after last hearing data on the channel for the duration of the DWAIT time, before it begins it's transmitter key-up sequence.
Recommended Values:
Digipeaters: 0
Local Stations : 160 (default)
PBBS's and HOSTS: 320
File Transfers: 480

FRACK 'n' DEFAULT: 3 (3 seconds)

Frame ACKnowledgement time in seconds, that the PK232 will
wait for acknowledgement of the last sent protocol frame
before resending or retrying that frame again.
'n' = 1 to 15 (seconds)

HBAUD 'n' DEFAULT: 1200 Bauds
Sets the PK232 to radio baud rate.
'n' can be: 45, 50, 75, 100, 110, 150, 200, 300, 400,
600, 1200, 2400, 4800, 9600.
HBAUD sets the "on the air" baud rate ONLY in the packet mode.

HEADERLN (ON/OFF) DEFAULT: ON
ON - The header for a monitored packet is printed on a
separate line from the packet text.
OFF - The header and packet text of monitored packets are
printed on the same line.
Only affects the DISPLAY of monitored packets.

HID (ON/OFF) DEFAULT: OFF
Activates or disables the automatic periodic transmission
of identification packets when operating as a digipeater.
ON - PK232 sends HDLC identification as a digipeater.
OFF - PK232 does not send HDLC identification.
The timing for the identification is every 9.5 minutes, and
cannot be changed.

ID
Sends a special identification packet. (HID must be set ON).
Sends a final identification packet when you're taking
your station off the air. The identification consists of
an un-numbered I frame with it's data field containing
your MYALIAS and your MYCALL and the word "digipeater".

ILFPACK (ON/OFF) DEFAULT: ON
Permits you to control the way the PK232 handles line
feed characters received from your computer.
ON - PK232 ignores all line-feed characters received from
the computer terminal.
OFF - PK232 transmits all line-feed characters received from
the computer or terminal.

Hi,
I'm moving to Calgary, Alberta later this year and I wonder if
there would be any point in bringing my packet equipment.

1. Is there any packet activity in Calgary?
2. Any possibilities for sending messages to Norway (any BBS/gtws/digi)?
3. What frequencies and baudrates are used?

Answers are MUCH appreciated.

And, for systems on the Internet (like ns.network.com :-)) use the callbook
server at marvin.cs.buffalo.edu, or it's evil twin, ham.njit.edu. The 'name'
command 'name Murray' will find all Murrays, and using the -f <firstname>
filter should reduce that to a reasonable list (unless you're looking for a
"John Smith"). So:

    ftp marvin.cs.buffalo.edu 2000
    >> name -f <first> <last>

From the rec.radio.amateur.misc FAQ sheet...

Devon

If you are at an Internet site you can connect using telnet to one

of the two primary servers:

callsign.cs.buffalo.edu (currently 128.205.32.4)
ham.njit.edu   (currently 128.235.1.10) (alias plan9.njit.edu)

The servers sit on port number 2000 which is a different port number than what telnet usually defaults to. So if you just telnet to these machines, you will get a login prompt instead of the server. How you tell your telnet program to connect to port 2000 instead of the default port is operating system dependent but it is usually done with a line like

telnet callsign.cs.Buffalo.EDU 2000

If this doesn't work, consult your local systems guru for the proper command string.

The interactive servers are designed to be somewhat self-explanatory and they support fairly detailed help facilities. The first command you should execute when connecting to one of these servers is "info". This will list general info about that server and how to use it. You should then type "help" to list the various commands available. Typing "help" followed by a command name will give you a little more detail about that command. Servers allow searches by call, last name, zip code or city and also provide regular expression filters to trim your searches so you get a reasonable amount of output.

Both these servers are built from a database distributed by Rusty Carruth, N7IKQ. This database currently contains US and Canadian callsigns and it does not contain club calls. A new version of the database is sent around approximately once a year.

There is also an email callsign server at callbook@sat.datapoint.com. In the body of the text, say "lookup" followed by callsigns you want to look up. If your mailer appends signature files, you should put a line "quit" at the end of your request (before the signature file). If you want help, put the word "help" on a line by itself. Here is what a request might look like:

```
help
lookup kc1sp wn4bbj
lookup n0fzd
quit
```

If you are a packet radio station, callserver data is available from REQQTH@WA4ONG.VA.USA.NA, subject line should be up to 5 US callsigns, separated by spaces. Body of message is ignored. The server is an OS interface to the MBL packet BBS using the Buckmaster CD-ROM callsign database.

You can buy a key with built-in code practice oscillator from MFJ for $$25.
The local emporium has two types of hand keys for sale, a traditional J-38
style for $8.95 and a plastic-base type for $4.75.

My first keyer paddle was two J-38's mounted back-to-back mounted
on an electric iron base. Total cost: about $5.

The problems of people pirating BBSes and/or using pirate callsigns are
not unknown to us in the UK too. Some months back there was someone in the
North of England who was logging into a particular BBS and reading other

people's mail.
I always compare the 'last on at' time displayed when i log in, with the time i recorded in my hard-copy log; this way i can see if anyone has been aliasing my call. To get round the problem of a pirate looking in the callbook and choosing a callsign of a non-=packet-user thats local to him, then pirating it, i have requested that my call not be included in the callbook. OK this does not cover every eventuality.
Maybe the time is right to start considering some form of 'token' based system for BBS and network access. A system that has been used by the Military on voice-networks for some time is a simple challenge/authenticate mechanism, where all the users are issued monthly with 'authentication sheets' (typically about 5 pages). Each sheet has an X-Y grid of letters and numbers and when you wish to enter a net, you are asked to authenticate a particular letter/number pair from a sheet; typically a challenge is of the form '3 71:3A' (meaning 'sheet 3, column 71 row 3A'). User looks it up and enters the response, which is checked against the machine's tables. The machine then marks that combination as 'used' so it is never selected again.
A similar system could easily be adopted for BBS access, either using paper sheets, or by some sort of software mechanism and a computer/calculator at the users end.
Alternatively, something along the lines of KERBEROS may be usable.
Packet transmissions are hard to DF (due to their short duration) using the traditional hand-held-beam approach. Maybe Doppler-DF could get them?

I have heard of Kerberos but don't really know much about it. Isn't
some kind of data scrambling involved? If so, that would probably
break the rules about Ham transmissions having to be in the clear.

If someone could give me a quick overview of the Kerberos scheme,
I'd appreciate it. Thanks.

Maybe a modified TNC that gated a carrier-strength signal with a qualified DCD,
opening the gate when the callsign was detected (ignoring the CRC) and closing
on the end flag ? Hard to use if the packet rate was slow, but perhaps good
enough ?

A connection to the illegal user (either from the DF TNC or from the BBS)
could also be used to generate a stream of packets on demand.

Here is a compilation of replies I've received when I asked about getting
started in packet radio, specifcally when using Microware's OS9 operating
system, and possibly a Radio Shack Color Computer.

From: Eddie Kuns <EKUNS@zodiac.rutgers.edu>
Subject: Re: Packet Radio
To: rh2y+@ANDREW.CMU.EDU, coco@PUCC.BITNET

"Russell E. Hoffman, II" <rh2y+@ANDREW.CMU.EDU> says:
]question: Is there any CoCo packet-radio (ka9q, internet-type stuff) software
]available or (better) any OS9 C-source (so i can run it on my OSK box)
I was talking to a friend just yesterday about CoCo packet-radio under OS-9!
<grin> He told me he uses KBCom for packet, tho not as a BBS. He's the sysop
or co-sysop or whatever of the Pinball Haven BBS (who's number I don't have
handy). My mind is blanking on his name at the moment, but you can probably
contact him via Mark Farrell (XLIONX) on Delphi, or maybe on the list or StG.

Are there any packet-ers on the CoCo list?

>> Is there any CoCo packet-radio (ka9q, internet-type stuff) software
>>available or (better) any OS9 C-source (so i can run it on my OSK box)
>>for such stuff?
    There are two modes for running packet. One is called AX.25, and
is usually supported by a microprocessor in the controller. All you
need is a terminal program to talk to it. The other is TCP/IP, and
requires special software in the host. I haven't heard, but I suspect
the KA9Q software is easily ported to OSk. For that matter, odds are
good that you could run it with Microware's Internet Package.

>> Also, in addition to the RFC's, is there a good source for
>>information on the subject (like specific issues of Rainbow, etc..)
    Dale Puckett (who's an amateur) occasionally comments on stuff in
his Rainbow column. Seems he rumoured that someone was working on
porting the KA9Q package to CoCo3/OS9L2, but I haven't heard anything

recently.

Your best bet is to ask on Usenet, either or both of comp.os.os9 and
rec.radio.amateur.packet. I suspect that the KA9Q package has already
been ported to OSk somewhere (shouldn't be too hard, I suspect), since
I recently noticed mention of Mac and Amiga versions.

>is there Unix source available, as this would be most likely the easiest to
>port from.
>   Also, as many of us are novices, we'd like to know basically what is
>necessary to get started in packet radio, and where to get information
>on the subject. I've heard that there are certain packet controllers that
>do most of the work themselves, and all you need is a terminal. Is this
>true? I know these are all FAQ, but i didn't see an FAQ list on this board.

Most packet radio controllers have self contained CPU's. Operation of
them is very simular to land line modems where you can issue commands
directly to the modem or in this case TNC as it is called. A terminal
program is all that is needed.

There is a particular type of packet radio protocol called TCP/IP.
Fortunately, there are some unix "hacks" to it from the origional
MS-DOS program. Unfortunaly, in my short search I have not been
able to find it at any site. I am sure it is out there, but
will have to look more to locate it.

Any more information needed, please send some more mail.

Russell

This is correct. Almost any term program will do for much of the work.
There are some specialized programs around in both public domain and
commercial,but to get started, all you need is a computer, term program, Packet
TNC, and
lets say a handy talkie.

I borrowed a TNC, bought a used HT for $115, and a power supply for $40.
I made a 2 meter ground plan for $5.00

That was it with the exception of my computer and term software.

Russell,

    I saw your not on the list. I am just starting to get into OS9
however a friend of mine is very big into the CoCo Users group here,
And some of the people I met through him Could probably help you.
There Is a person in Rochester NY who runs a BBS on a CoCo III, and
I know that he is also running it on packet. Sorry, I don't have the
BBS phone Number (I can get it if you like) but his name is Bill
Whitman and he runs Delta Systems BBS, which ALSO happens to be on
USENET, as deltas.UUCP. You may see if he can help you.
    Last Time I knew though he was in the middle of upgrading to the
new 68000 machine for OS9, He was going to buy it at the convention
last weekend. Good LUCK!

From: jpd@pc.usl.edu (Dugal James P.)
To: rh2y+@andrew.cmu.edu
Subject: Re: How to get started in packet radio?

To access a Packet BBS you would need a TNC, a terminal emulator,
and an interface cable wired for either rs232 or perhaps TTL (depending
on computer and TNC capabilities). The TNC has a Z80 cpu that does
all the work.   It has parameters to take care of wrapping long lines,
adding cr/lf, etc. So a COCO should work fine.

Now, to use a COCO as a PBBS, you will have a problem ... most software
runs on a PC. There may be C code available from TAPR which you
could recompile for the COCO, to do this. Let me know if you need TAPR's
address (== Tucson Amateur Packet Radio, the tnc2 originator).

There is software now available from Germany that enables a PC to
emulate a TNC ... with minimal hardware and lots of software. Waste
of a PC, in my opinion.

Ok, to get started, contact your local A.R.C. (Amateur Radio Club) to get
classes and testing for your Amateur Radio Ticket.
Next, scrape $139US for an MFJ-1270B TNC. And YES all that is required is
a terminal. The TNC (Terminal Node Controller) is a Modem + Synchronous UART

+ Packetizer + Mailbox + Node + RS-232 interface. If you are REAL OS-9 hacks then the TNC-1 (not sold anymore) uses a 6809 processor. The MFJ (A company name, a prefix and a TLA for My Friends Junk :-) TNC is also called a TNC-2 and uses a Z-80 processor in it. The TNC uses AX.25 (modified X.25) over the air.

Now, UNIX software, well there are BBS's all over the place for the Packet Domain available. There is also TCP/IP networking software, commonly called KA9Q NET or KA9Q NOS, and is publicdomain.
I have kept this short, if you have more detailed questions or want more detailed answers, drop me a note, I'd be more than willing to fill you in a LOT more.

Ciao, 73 de VE6MGS/Mark ...!laberta!adec23!mark mark@ve6mgs.ampr.org -sk-

Subject: Re: How to get started in packet radio?

I'll have to get TAPR's addr from home. w/r/t Internet access via packet, it can be done using KA9Q's NOS pkg but there are rules that really limit how much can be done. Recently the whole question of content has come up and it hasn't settled down yet! One problem is that a 24-hour gateway that is well-known would permit non-hams to cause it to xmit by doing, say, a ping. This may very well be illegal (for the ham whose license IDs the gateway). Sort of like reverse autopatches (which exist in some areas of the USA). If you do get licensed and putr a gateway up, best keep a low profile!

Hi Russell ... You've probably already heard this ... but I
just answered this for KB5LBO here in Austin, and will pass it on to you also.
Find a copy of the May 1991 issue of "73 Amateur Radio Today" magazine, and look on page #64 at the "RTTY Loop" column. They list some sources for Color Computer Packet software (and other goodies).

For starting materials, I suggest ARRL's "Gateway to Packet" book. Some of the material is outdated -- as will be any "book" on a subject that is changing so fast. Overall, though, it is a very good introduction. There are other books and authors available. Most of the HAM magazines have regular columns on packet radio.

Beyond that, check with your local Ham clubs, ask questions of your local Ham friends -- SOMEONE in your area will be doing packet. They will likely be your best source of information re: what is happening locally. It is different from city to city even though some "standards" exist.

One other thing ... plan on upgrading to Technician (or higher). Although there is "some" packet on HF (10 Meter Band), most of the action in on 2 meters (and higher). For HF, other digital modes (AMTOR and RTTY) seem to be more popular than packet.

Hope that helps! Good Luck.

SOLAR TERRESTRIAL BULLETIN

03 May, 1991

Administrivia

/\

PLEASE NOTE:

Solar Terrestrial Dispatch now has access to the Usenet community. Previously, the solar geophysical reports, alerts, warnings and other messages were posted through gateways into several Usenet newsgroups. Unfortunately, this prevented us from reaching some of the other relevant newsgroups (ex. sci.astro). Over the next week or so, we will be attempting to determine whether the reports propagate through the newsgroups faster by posting through the gateways or directly to Usenet by bypassing the

gateways. We will choose whichever method yields the fastest general propagation time.

     It would be appreciated if some of you could respond to this message, confirming its arrival through Usenet and noting the time of arrival. If any of you are familiar with the previous delay which accompanied the Solar Terrestrial Forecast and Review (STFR) reports, please send a note comparing the time required to receive this message with those of previous STFR reports. This will help us determine which method and path will yield the quickest delivery times.

     On another vein, please note that a mailing list does exist for those of you who are aiding in the redistribution of the solar terrestrial information, reports and/or warnings to the packet-radio networks and/or other networks or sources. Those organizations or individuals who require the information quickly for research or dispersal purposes, or who redistribute the information to other sources may request that their e-mail addresses be added to the distribution list.

Please send replies, requests or questions to the following address:

   INTERNET: oler@hg.uleth.ca

A public announcement of the Usenet address will be made after the final adjustments and tests are complete.

     Thanks to all of you who send confirmation notes.

I am interested in using the new pacsat satellites with non-directional

antennas. I would like to hear from anyone who has done this. I would like information on the antennas and power used, data throughput, and anyother information you feel is necessary and important. Any information would be appreciated.

TAPR METCON-1 Beta-Test kits available

METCON-1, a simple teleMETry and CONtrol system for packet radio, is now available for limited Beta-Testing. Twenty complete Beta-test kits are available from TAPR (Tucson Amateur Packet Radio) that where brough back from Dayton. The METCON-1 kit is composed of the main METCON-1 control board and one Voltage-to-Frequency board. The system operates by connecting the main METCON-1 system board to the RS-232 connection of a TNC. The remotely located packet TNC and METCON-1 system are then accessed by connecting to the TNC. The METCON-1 system acts like a remote computer connected to the TNC, much like a BBS operates. The system uses a 8751 microcomputer to allow a connected user to read and write on/off levels at the microcomputer's I/O port using a command line oriented command language. Outputs are dry relay contacts so you can hook up anything you want, within reason. A good upper limit is 24VAC/VDC at 1/2 amp. There are 6 outputs possible with the standard METCON-1 PC Board.

An added feature of each standard input is that METCON-1 can measure the frequency of an input signal (0-10KHZ) in addition to simply indicating if the input is an open or closed circuit. The advantage of this type system is that the external Voltage-to-Frequency converter board configured to read either Temperature or Frequency can be placed right at the source to be measured. An opto-isolator is used to allow isolation between the V-to-F board and the main system board. One V-to-F board comes with the kit and can be constructed in either configuration (temperature or voltage).

Although METCON-1 is a simple system, it does have a number of nifty features. These features include a time-of-day clock that can be used to time stamp output, the status table can be dumped on set intervals (0,1,15 minutes),

block reads and writes are supported for fast memory transfers, notification can be set at different states, and other additional features are available.

This Beta-Test is for interested individuals that would like to participate in a limited TAPR testing of the METCON-1 system. The results of the testing will help further refine the definition of METCON-1 and define application usages for the next stage of development.

Some of the applications described so far by beta-testers include using the METCON-1 board during a balloon ascent for sending telemetry regarding height, temperature, and other balloon status to the ground control station as the mission proceeds. Many other applications dealt with control and monitoring of remotely located sites. Many of these remote sites included mountain top stations and other difficult access areas. Applications for the METCON-1 system are endless.

There are currently twenty METCON-1 beta-test kits available from TAPR. If you would like more information on METCON-1 or how to participate with the beta-testing, call the TAPR office at (602) 749-7494.

Regarding Security/Piracy.
==========
This may be the simplistic solution, but surely the answer to this is
not to go the complicated route of Look-up tables, codes etc., after
all this is only a hobby, but never to put a Packet message to a friend
or anybody that contains something that you would not be ashamed to let
anybody read!!!
Your comments would be of interest.
Packet is confusing enough without codes, ciphers etc as well!!!
Let us keep it simple at all costs.

I have one comment on & one problem with what you're saying. First, security,
passwords, etc. are because of the people who don't play by the
rules; if we all *knew* the "other person" would be OK, we wouldn't need
any security. Because (as experience has shown) we can't trust everybody --
even if it's an honest mistake -- we need to explore ways to achieve
enforced trust with minimum hassle.

Now, re: "keep it simple at all costs". I can spell SSB, but don't ask me
to design/build/modify a xcvr -- but I don't think everyone should be
restricted to AM 'cause that's all I can do. If you only want to use a
service as a tool, without understanding, then lobby for a simple user
interface. For me, anyway, the hobby is figuring out how to make it work.
And it should be easy enough for non-addicts. 8-)

Cheers,
 Willis Marti

I'm my KAM, there is a mini-W0RLI compatible mailbox that will do message forwarding and receiving of normal AX25 mbox commands.

We are trying to get a NOS system to forward/poll it, and so far we can get email flowing between the NOS system and the Kantronics MBOX without any difficulties.

However, the Kantronics mailbox will not call out, it has to wait to be polled by the remote station.

Is there anyway to setup a polling schedule in NOS for AX25 BBS connects?

Hello Packet World...

Being very new to packet, I was wondering if anyone out there has run across any terminal programs that can be used in 40 chr mode? I am considering

running portable with one of the "palmtops". What do you Atari users do?
I'm actually interested in something more than a terminal program if anything
exists. Any help would be appreciated.

There cannot be any security unless the messages are coded. This is not legally
posible. All anyone needs is to monitor the packet frequency and either read
everything or wtite a simple filter program to find 'header' frames that look
interesting!

Just ordered a TNC-2 (MFJ127xB ?). For some months I have been using
my PC to do UUCP (WAFFLE) for email and news with the Usenet world.

Has anyone else been relaying and timesharing their PC between packet radio
and new/mail over usenet ? found or written gateway software ? Sure would
be neat to be able to ship some news and mail in and out. (No it is not in
violation of any laws or rules.)

Thanks for any clues. /Ev WA6CRE/

I tried this over the weekend. It turns out that the mac software doesn't
have a route command for ax25.

But I did get a note from kg6kf, who added me to the route table for wn6i-7.
So we'll see how that works out.

Thanks for the info, everyone.

>As for no one building a TRF receiver in most of a century, check out the
>Ferranti ZN414 AM Receiver chip

     Okay, I guess I was a little strong on that statement; what
I really meant was that TRF receivers usually show up as little glue
components (like in a garage door opener) rather than as a 'receiver'.
Yes, there IS a place for tuned RF receivers, but conversion is
the norm nowadays (and has been for quite a few years). TRF works
best at low frequency (where the Q of an LC circuit offers adequate
selectivity), and its only real advantage (cost) has rather been
taken away by the cheap ceramic IF filters in use nowadays.

Try apple.com in their directory /pub/ArchiveVol1/tcpip/ka9q

Their are other sites which carry ka9q net, but I am not sure
if it is for MAC.

Hope this is of help.

Greetings,
Michel (ON6ML)

We were about to replace a working thenet v1.1 with thenet plus 2.06 locally
(ie most of Ireland). Could somebody with experience of v2.06 and v1.0/v1.1
compare them for reliability in single and dual port configurations?

A friend in SUN told me that one of his colleagues has written a modem for that
audio port. Just a simple 300baud (V21) modem as far as I know. I've got no
other details, although I can ask.

Good idea for a GAME Willie, but the real use of T-hunting is to prepare the hunters for real situations like tracking down jammers and finding downed aircraft. The targets normally don't cooperate in this way. Using packet to coordinate the hunt is a very good idea and one that has been picked up locally. The bad guys have scanners and always seem to find your coordination frequency and come up to taunt you. Using packet on a busy LAN frequency totally frustrates them.

While on the T hunt topic, does anyone have experience with using a doppler direction finder coupled with an in car Loran C unit and a laptop to do automatic triangulation on the move? Also, is anyone using a group of fixed stations linked in real time by packet to do automatic triangulation? Cooperation is the only way to nail these guys fast.

No experience, but the idea has been talked about a lot. We're working on building some of the DDF systems and one thing that came up was using packet to coordinate DFing efforts.

We thought of using a DDF system, positioning box of some sort (Loran-C as you say, mainly because they are cheap), and some sort of electronic compass. As you drive around, the software would take the bearings, headings, and locations, and start building a probability density. Ah yes, digitized topo information might be useful, too.

The next step would be to link all participating stations with packet. Doesn't really matter if they are fixed or mobile, as long as the data interchange is standardized.

Again, none of this has been built. We have built a bunch of TDOA systems (ala Handy Tracker or Vector Finder) and are in the process of building a DDF system based on the DoppleScant article in QST (an aside, anyone have a *correct* schematic?).

Another aside, anyone consider building their own Loran-C? It may not be worth it, since I've heard of inexpensive units for low $200s.

Hi
I have a license from India. Could someone please let me know what do I have to do to start operating from here. I vaguely remember someone having told me that there is a reciprocal arrangement between the USA and India wherein operators from one country could operate in the other with the license obtained from the parent country. I doubt the validity of this but would like to know the rules.

Thanks in advance
Girish

Turns out I'm going to be driving to Dayton again this year, and at least
part of the trip I'll be driving alone. I'd like to solicit suggestions for
2m and 70cm FM repeater freqs along the way, so that I can soak up a dose
of real humanity in between CD's... :-)

The route will be Colorado Springs to Aurora, IL, on the 19th and 20th of
April, then Aurora to Dayton on Wednesday the 24th, and then Dayton to
Colorado Springs on the 28th and 29th.

I have a few repeater freqs scribbled in the margins of last year's AAA
TripTik, particularly for central/eastern Kansas, but I've never driven I-80
before.

Suggestions?

If others want to jump in with queries about other routes, feel free! And if
you're going to be at Dayton, wander by the Grace Communications booths at
#570-571 and say hi!

There appears to a missunderstanding in my last post. The buggy code refered to was 1.16 and NOT, I REPEAT, NOT 2.06. There are some things in 2.08 I REALLY DON'T LIKE, but it works too. Like in 2.08 it seems all the level 3 parms are hard coded in the eprom and are not remote changable. (REALLY HATE THAT! GO BACK THE OTHER WAY GENTS!). The call lockout feature for level 2 stations is a real abuser if it gets into the wrong hands. A good idea after the WA3QNS 900-number mess, but it opens the door for unscrupious persons to wreak havic in the network of your choice, TheNET, TCP-ip or (if you are unforunate to have a ROSE in you area).

Hope this gets to the authors of TN PLUS 2.08.

I have an original TAPR TNC-1 running in KISS mode with NOS. I have noticed that the TNC-1 has a tendency to drop packets from other stations. I have swapped out the TNC-1 with other-brand TNCs but using the same radio and found that the other TNCs do NOT lose packets like the TNC-1 did. After extensive monitoring, I've come to realize that the packets being dropped come from stations that use (relatively) short TXDELAYs. However, these same stations don't have trouble connecting to stations other than mine (probably because

they're not running TNC-1s).

I've recalibrated the TNC-1 and everything looks ok. The DCD light will come on properly anytime the radio hears a packet. But as I said, packets tend to get lost as NOS shows intermittent received packets from those stations (when full tracing is turned on).

There is supposed to be an upgrade kit that turns the TNC-1 into a TNC-2 and I'm wondering if this upgrade might improve the TNCs performance. In other words, is the KISS code in the upgrade kit any better than the TNC-1 KISS code? Or perhaps the problem isn't in the KISS code but in the modem's PLL lockup speed? (And for that matter, does the upgrade kit come with KISS capability?)

Anyone have experience with either the upgrade kit or using the higher clock speed in a TNC-1? I've also tried using the faster clock speed but it seems that EVERYTHING that's timed is reduced by one-half. So I'm guessing that some EPROM timing mods need to be made before I can run at the higher clock speed in the TNC-1. What kind of mods need to be made to the EPROMS?

Sorry for two messages on this, but in my last one I forgot to mention
any description of version 1.0 and 1.1 and there is one very important
thing to know about version 1.0 of TheNet!

Version 1.0 has a very severe problem when running in a back to back
configuration with another node. It develops routing loops between
the two wired togeather nodes. It did this with another 1.0 node
wired in, and also a Converse node. For this reason, 1.0 is NOT
recommended for back to back use unless the second node is a Converse
node with NO radio hooked to it, and you set the minimum quality for
auto-update equal to the RS-232 quality. This will ensure that it will
only update the other nodes callsign that is actually hooked to it and
will not update any of the nodes that the 1.0 node actually hears on
the HDLC port. This is a really kluged up way to get around the problem
and it would be a lot better just to switch to 1.1-E

1.1-E is the entry node version and is sometimes just called: 1.1
It works in all configurations that could be tested, but you can not
turn off level-2 connects, and you can not set TXD remotely.

1.1-I (or TN11-I) is the backbone version of 1.1 It allows no level
2 connects other than the sysops and up to four other callsigns which
the SYSOPS adds. Two when you burn it, two later by uplink connect.
This version was intended only for "node to node" level 3 connections
in a backbone.

And rambling on.... one other thing I forgot.... version 1.16 does not
have a "host mode". All other version of TheNet do.

Sorry for having to send two posts to cover all this.. my memory is
slipping. :-)

Paul Healy, phealy@cs.tcd.ie then asks:
>We were about to replace a working thenet v1.1 with thenet plus 2.06 locally
>(ie most of Ireland). Could somebody with experience of v2.06 and v1.0/v1.1
>compare them for reliability in single and dual port configurations?

Let me make a few comments on this since Charles and I are friends and we were both looking at the same problems from two places in the same state.

Version 1.16:
Has lots of really GREAT features. A lot of things can be turned on and off with this version that are really helpful. However, there were some things that were unexplainable.

1. When a node with version 1.16 made a level 3 connect from the nodes list to a node running 1.0, the remote 1.0 node would show a LEVEL 2 UPLINK from the callsign and SSID of the 1.16 site connecting to it. This in ADDITION to the CIRCUIT being shown.... as normal.

After the connection was broken, the remote node running 1.0 would STILL show the level 2 UPLINK from the 1.16 nodes callsign and ssid as being active. It only went away after the "no activity timer" on the parms setting deleted it.

It also did some weird things when connecting to G8BPQ nodes. The 1.16 would initiate a level 3 connect, and the G8BPQ node would respond. Then the 1.16 would show the G8BPQ as a level 2 connect, would send it the list of available node commands (like a user that had made an incorrect command) and would THEN stop and would leave the user making the connect attempt right at the 1.16 node and NOT connect him through to the G8BPQ node.

A SECOND attempt would go right through. If the false level 2 uplink was allowed to time out, this sequence would repeat all over again.

All kinds of settings on parameter 30 were tried with no success at curing this problem. Comments are invited by users of 1.16 since it sure appears to be a neat version of TheNet and does a lot of things that are very helpful as Charles noted.

Version 2.06:

This version works perfectly and I have had no problems with it. I do not think that Charles has either, but I have only talked to him once today. It works over the RS-232 ports (back to back) perfectly, and I have had ZERO problems with it. Advantages are remote setting of Transmit Delay, among some other things... but not the choice to disable level-2 connects like ver. 1.16 had. It also adds the (H)eard command, which

is like the MHeard feature in your basic TNC.

Version 2.08:

I think that this MIGHT have been the version that Charles was talking about. It has some great but rather dangerous features. First, it allows level 2 connects to be disabled as to make the node into a backbone only version. It ALSO has defined two dummy port assignments. This allows a sysop of the node to make a manual ROUTING entry that will dump a specific callsign with specific SSID, or a specific callsign with ANY SSID to a dummy port. I.E. You lock him out of the node. This is basically an administrative feature that allows a system manager to lock out completely a BBS or Node or ANYONE that thinks that the whole system is there to do anything he wants with it, no matter how damaging it is to everyone else.

However... the PARMS settings are really whacko! I say that only because I have gotten used to PARM settings being in a certain order and being able to adjust certain things. With THIS version, you no longer have access to all PARM settings except when you initially burn the EPROM. The ones that remain are out of order from the usual sequence. It takes awhile to get used to this. Basically most of the Transport settings can only be changed by burning a new EPROM. Same with the password... burn it once, and that's it. You can't change it from the 232 port.

Spaces can be included in this version (in the password) but in version 2.06 if you put a space in the password, it causes problems.

I am running this version now and have had no problems with it at all and I have another TNC running 2.08 hooked back to back with it. Send me a message if you want more details. I just wish they at least had made all PARM settings available after sysop validation. One version of this code needs to go on a 2000 foot tower, and I do NOT want to go up the tower just to change a PARM setting carrying a new EPROM and a screwdriver.

Texas Packet Radio Society

TPRS information and TexNet version 1.6 code is currently available on
PONDER.CSCI.UNT.EDU by anonymous FTP. All files are located
in the pub directory under TPRS.

A NEW directory is available to allow Texas hams to drop off
TCP/IP address listing and other information that you might want
me to store away.

Currently the South Texas TCP/IP address are available.

If you do drop something in the NEW directory, please send me EMAIL
so that I will look over at the information

Has any of our European reader of this list got a list of European
repeaters which are kept on most of the day ? I am particularly
interested in VHF repeaters, along a route from Italy to UK.
Please answer directly to me since I am not on this list anymore.
Thanks -

Olivier M.J. Crepin-Leblond, Networks Research,
Imperial College of Science and Technology, Elec. Eng. Dept. , London, UK.

From: cornett@seattle.crd.ge.com (dan cornett)
Newsgroups: rec.radio.amateur.packet
Subject: HELP with MARS MCS PBBS Problems (long)
Message-ID: <18515@crdgw1.crd.ge.com>
Date: 15 Apr 91 17:02:15 GMT
Sender: news@crdgw1.crd.ge.com
Organization: General Electric Corporate R&D Center
Lines: 50

I helped my uncle install MCS for his MARS packet bulletin board, but it doesn't work quite right when started. The version is 6.7.2 running on an AT clone; his TNC is a KAM, which MCS supports.

PROBLEMS:

1. TNCSET does not work correctly - it cannot find the 1A5 entry in the tnc1a5.scr library. Using a utility to locate strings in the library revealed only 1a4 entries. tnc1a5.sqz was not on the disks. Is there a way to use vidpop to create the entries? Can the .sqz file(s) be obtained (there is one for mail600)?

2. After hand loading the information that TNCSET sets up, MCS is started. The window/port message appears, then the TNC's CMD: prompt. However, there is a heart on the screen to the left of CMD:, the prompt is followed by the letter 'C' (should be expected, it seems, per the documentation), and a message to the effect "LINK STATE: Disconnected" (again, should be expected). At that point the system loops with the heart CMD: prompt followed by the 'C' followed by the "LINK STATE:..." and so on.

3. Control E does not operate - it is in the config.mc file. It is necessary to reboot to kill MCS.

4. TNCBAUD is missing. We set things up by hand (port and TNC).

Using 6.6.1 rather than 6.7.2 produces the same results. I suspect pilot error on my part.

Can anyone give a hand, please?

In addition to the immediate problem of getting him going, I have some questions that may help later:

1. Is there any doc on vidpop?
2. From where does MCS obtain the type of TNC connected - the setup program asks which TNC, but I cannot find the file

that holds that information.

Uncle Ray's MARS call sign is AAT5LC - I do not know his ham call sign.

Thank You,
Danny Cornett cornett@crd.ge.com

I figured that when at the end of a conversation about computers with a colleague one of our coworkers said ***I didn't understand a single word you guys said*** that I had reached the pinnacle of jargoneese. Now that I'm into packet radio, I find that I have to learn a whole new language again. Therefore I need some help with what the following packet buzzwords mean:

1. TheNet
2. NetRom
3. Net.Exe
4. NOS
5. KISS

and

6. What's the difference between a TNC-1 and a TNC-2

I am already somewhat familiar with TCP/IP (read: I know what the acromyn stands for). If I've missed any **in** buzzwords please fill me in.
If you don't want to fill up bandwith here with information that has been provided a million times already feel free to send it to my packet address below.

Thanks for the help.

Well, I too am a packet beginner and haven't found any of this in the books
that are on the market...they just talk about AX.25.

A while ago, I posted a request concerning what advantages changing from
AX.25 to TCP/IP would have for me.

Got no responses...

Does anyone know of a good packet handbook that fills in the gap between
beginner and packet technoid level?

...and please post your responses to the original questions above to this
group...I'm sure there are others who have wandered into packet radio and
want to learn more...but are not up to the 56KBaud stuff yet! :-).

Thanks.

So prove it can be done, make it work reliably, and you have just done
something _wonderful_ for EPIRBs and PELTs. If there's a proven advantage
(one aircraft can find the hiker with a broken leg in a national park in
half the time of two aircraft or whatever) you will start seeing this
capability show up in PELTs and EPIRBs. Sure it doesn't help with the 'old
style' gear or jammers, but maybe it's worthwhile anyway...

The only thing I have to add in regard to the information posted here
already is that the thenet plus 2.06 eprom setup program is excellent.
The original attraction to us of 2.06 was the (simple) mheard command.
I now think that a switch to 2.06 is warranted simply by the setup
program.

Thanks to everyone to took the time to reply to my question (oh3nwq,
wb4wor, wa3jpy).

Does anyone know if there is likely to be anything after 2.08? (or 1.16?)

mgb> of available node commands (like a user that had made an incorrect command)
mgb> and would THEN stop and would leave the user making the connect attempt
mgb> right at the 1.16 node and NOT connect him through to the G8BPQ node.

This may well be to do with the L4 timeout handshake that BPQ nodes send
when making/accepting a circuit connection. If you were to watch a BPQ
node setting up a circuit you would see one character of info (an 'x')
being sent to the remote node. TheNet 1.0 and 1.1 don't seems to care
about the extra data tacked on after the NET/ROM conn ack/conn req frame
but other TheNets might be more fussy. Get someone with a decent monitor
eg WA8DED or TCP/IP NOS or NET to watch the NET/ROM transactions for you.

Hope that helps, 73

Mike

Don,

Much appreciate the info. If I have it all right it means that:

1. TheNet or NetRom is needed to be a NetRom node.

2. Net.Exe or NOS is needed to run TCPIP with KISS in the TNC.

Looks like my Kantronics KPC-2 is a TNC-2 type then as it has KISS and a

mailbox. Now if I can just get it to transmit in converse mode after I connect I'll be doing good. Works great in command mode for a connect or disconnect command but is dead in conv mode after connecting.

  Looks to me then from what you say that there are three protocols in use: AX.25, NetRom and TCPIP. What are the advantages for you of running TCPIP under NOS as opposed to running AX.25 ?

  Thanks again for helping a new guy with all this stuff. 73s and CULater

There are clubs that may be of benefit to people who want to learn more about packet radio. Here's some info.
North East Digital Association   (I'm editor for this one)

Box 563 Manchester NH 03105 - NEDA runs a LARGE TheNET network of
35 multiport nodes over a 400mile range including
Boston, Concord, Manchester, Springfield, Pittsfield
Albany, Utica, Rochester, Binghamton, Buffalo. No
phone lines, no tricks, just 150 radios/TNCs with
dedicated point to point UHF, 220, 6m, 900, 1200mhz
links and 2m and 220 user access ports. The club publishes about 180
pages /year of newsletters, new user help stuff, tech stuff etc.
The Quarterly is about 35 pages/quarter.
Membership is $15/year for US. Send a SASE to the
POBox.

Northern California Packet Association
This is an education and coordination club that puts out a quarterly
journal called the Downlink. The one I have here is 20 pages long and
is chock full of packet stuff. THey are
NCPA   6680 Alhambra Ave, Suite 111 Martinez CA 94553

Then there's a few magazines:
New England TCPer - This journal comes out 6 times a month and $12/year
NE TCPer 252 Stow Rd. Harvard, MA 01451

Digital Digest - TCP, AMTOR, RTTY, CW everything 6 times a year and
is 30 to 40 pages long including commercial advertising. $16/year
Digital Digest 4063 N. Goldenrod Rd Winter Park Florida 32792

Joining a club, even a non-local one is a good way to get into correspondance
that will answer some of the harder questions. One of the items that
I helped create recently for NEDA was a 13 page glossary of packet terms
that the club will probably make available. It was created for a technical
developement meeting in Scranton Pa a couple of weekends ago.

(Robert Taggart) writes:
>
[What are these buzzwords?]

>1. TheNet

A clone of Netrom written by a group of German hams. Source available.
Distribution free.

>2. NetRom

Proprietary code for the TNC2 that establishes a low level network capablity
for level 2 users. Sold by Software 2000. It allows a user to "uplink"
to it via AX25 connected mode and issue commands to establish a connection
to another Netrom node then do a "downlink" to another level 2 user. The
internal network protocol uses UI frame datagrams. Features semi-automatic
routing.

>3. Net.Exe

A version of TCP/IP written by Phil Karn KA9Q for the IBM PC. It has been
ported to the Mac and Amiga. Allows peer level connections with other
stations using the IP protocol suite. Available commands include telnet,
ftp (get and put files), and smtp, a mail delivery agent. The package will
also do level 2 AX25 connections to users running ordinary TNCs. Requires

a KISS TNC or a DRSI board or one of several other hardware cards to
interface with a radio. Includes ethernet support. Supports multiple
ports. Each peer station is capable of IP routing.

>4. NOS

Network Operating System, a version of TCP/IP written by Phil Karn that
uses "lightweight multitasking". This is the current version of Net on the
IBM PC. Many enhanced functions over the older Net.Exe.

>5. KISS

Keep It Simple Stupid, operational software for the TNC2, and others,
that removes the AX25L2 protocol from the TNC and passes all packets
to your computer for further processing.

>6. What's the difference between a TNC-1 and a TNC-2

The TNC-1 is the original TAPR designed TNC. The TNC-2 is TAPR's second
generation TNC. They use different processor families with the TNC-1
using the Motorola family and the TNC-2 using the Zilog family. The
TNC-2 design is the most widely licensed and used design today.

This kinda suggests the need for a Frequently Asked Questions list for
rec.radio.amateur.packet similar to the wonderful lists that Diana Syriac
(dls@genrad.com) puts together for rec.radio.amateur.misc. Any volunteers?

I would, but I'm not what you would call a packet "expert" and I am busy
maintaining the Elmer's list.

Hello friends !

Maybe I can help to clarify a little TheNET confusion.

NORD><LINK made theNets (VERY strongly influenced by WA8DED work)
available in source and binary forms a long time ago.

A month or two ago I received a floppy with all compilers and
tools needed to make own version.
I got sources for TheNET 1.1 normal,interlink, user-access;
as well as COVERSE and TF21d. So, this are official versions
from NORD><LINK.

There are two versions widely circulated, both based on TheNET 1.1.
TheNET 1.16 is an intermin version toward 1.20 (I hope !) made by
HAMs close to NORD><LINK (but not DF2AU himself); while 2.06 is
made in USA. I saw several other versions which are definitely pached
EPROM images... Just count number of characters !
Most versions just play with user commands processor - but
nobody tried to make faster interrupt routines and better level 3
routing.

2.06 has very nice documentation, so it is worth FTPing from TOMCAT;
but I do not beleive it is worth climbing to the mountains to

replace EPROMs. Single usable function, not found at
1.1, is HEARD list of last few calls. This is not usable on our
busy 2m channells - because node hears much more stations
as can be connected. Routes list use IDENT instead of CALLS, what
just add confusion. Another nice feature is NOT FOUND message answer
to "N UNKNOWN" command. At least in our region 2.06 is used mainly
by SysOps who collect versions (must get TheNET 3.13 for them !).

1.16 is really next step. They throw away useless code for
user terminal, so RS-232 port is NET/ROM ASYNC protocol only.
They got space in EPROM for few nice changes.

Reasons, why we put 1.16 to work in YU3 network:
- T 60 command puts TX to transmit 60 seconds of test signal.
  This was badly needed for antenna tuning on 23cm.
- Remote adjustable TXDELAY
- "N UNKNOWN" command is replayed by "Not found"
- Several flags to set mode of level 3 beacons
- RESTART commands clears links, but keeps routes and nodes

Another features, liked by users
- CTEXT message (QRM, as all CTEXTes - but HAMLETs like them !)
- QUIT command, which RECONNECTS back
- NODE ? gives nice sorted list of known nodes.
- LED 0,1,2,3 instead of HI/LOW

Now... BUGS:
We run several TheNET nodes on 38400 bd radio speed/ 9600 bd RS-232.
They are connected to other nodes via diode matrix or FKROM (EPROM
with logic for 4 TNCs, using TTL level ASYNC TNC lines. I hate
diodes ...). All tested versions have a bug in LEV3 or LEV4:
With nodes going up/down memory become corrupted and node blocks.
But, after I enforced stable network (NO nodes with 0 quality),
keeping maximum number of nodes at 20, they are quite stable.
Users know: To go to OE, call 4N3P. To go to Italy, call 4N3K. To south,
call 4N2Z.

1.16 bugs
User interface on RS-232 is out. SIO pin 22 is no more needed.
But - take care with single node - it attemps to send routing
beacons to RS-232, and they eat memory, waiting for port to be ready.
So, FLAGS 5 1 is MUST for single nodes (AND remote reset). It works
fine in company.
1.16 sends CTEXT for EVERY lev.2 link - and if you block CTEXT,
blank INFO frame with PID F0 is send on any connection, G8BPQ hates
this, and they like to exchange several QRM lev.2 frames with PID F0.
There are also some minor bugs in output messages for SYSOPs, like
entering INFO and reading it in same QSO.

1.1y is yu3fk version - I try to get better results on 38400 bd by
lowering link number (25 is too much for interlink nodes) etc. Only
few mods to 1.1 - I do not want to make big changes on old version !

Best 73 and happy networking !
   Iztok, YU3FK@YT3A.YUG

Wrong.

Folks should be aware that THEnet(sm) is a registered service mark of
the Board of Regents of the University of Texas, and may not be used
without permission.

It also happens that TEXnet (tm) is a trade mark of the Texas Business
Network, Inc. I don't know who they are; I'm only affiliated with UT.

Good luck. I assume that you can prove "THEnet" predates "TheNet" and
have figured out whom to charge with infringement. I think your best
course is to give permission (if you can find someone to accept it.)

I think that's a non-sequitur.

THEnet (presumably) is Texas Higher Education network, perhaps? note
the three uppercase letters.

TheNet is a German freeware implementation of the same protocols as
NETROM. Note the lower case "he".

See? Different name. Not that I'm a lawyer. And I don't see how
the two can be confused. Heck, Digital goes to great lengths to
protect its ALL-IN-1 trademark, but you can buy All-in-One Steak Sauce.

>(I prefer Texas Best, myself.)

First, I should say that I'm not a lawyer myself, nor do I speak for
the Regents. My prior posting (and this one) should be considered, I
hope, just a friendly observation to some fellow networkers.

That aside, it should be said that trade and service marks are not
like patents. Prior use is not much of an issue. Punctuation and
capitalization are not much of an issue. For-profit, not-for-profit,
private individual or corporate use is not much of an issue. If, in
the mind of the consumer, they can be confused there is probably a
conflicting use. You can bet that if H.J. Heinz started marketing A-1
office automation, Digital would be on them like... well, you know.

As to whether there's a real conflict in this case, let me give a just
barely hypothetical example.

The Texas Education Agency has been charged with the task of building
an "Electronic Information Transfer System" (read network) to bring
together all the public schools in Texas. In the course of deciding
just what structure and technology the network should use, two
of the proposals made stood out.

Proposal A made use of the existing higher education networking
facilities, in conjunction with university staff expertise to make
dial-up (V.32) connections to internet-based information resources,
like usenet news.

Proposal B made use of existing packet radio technology already used
in Texas to avoid telecommunication costs and provide a completely
flexible infrastructure.

Proposal A wins the day.

(Begin hypothetical part)

Some time later, when testifying before the Texas senate education
committee, a senator whose ox has been gored grills the head of the
agency. "Why didn't you use this network, this thenet stuff like we
talked about? I thought that held great promise to bring networking

to the schools at very little cost to the taxpayer. Well, Mr.
director?"

So, Fred, which thenet does the senator refer to? Would you say
there's a service mark conflict here?

In any case, this is probably not of much interest to the packet radio
community at large. I'm sorry to have taken up so much bandwidth with
these marginally topical postings. -Jeff

Registered in the US, only, though. Remember, this is a German program.

Good luck proving/enforcing infringement on a freely distributed program
with no identifiable US importer or reseller. Besides, "the net" is a
generic description of a network and is only registerable in a very specific
form, such as "THEnet" with caps, etc. Even then, it might be considered
too generic if it comes to a court test. Want to try?

Bill Hester asks for information which is better to run, tcp/ip or ax.25.
This won't help the net here much, but connect to K0YUM on 145.01
(I have to go thru ARA4:W0LJF-4 to get to him) and ask Fred. He seems
to be one of the more knowledgable people in the area.

Personally, I find NOS pretty nice. It lets you have regular AX.25
connections as well as telnet, ftp, smtp and net/rom connections all
going on at the same time. It also allows you to have a mail box that
messages can be forwarded to.

Well I think the keyword here is "new". I imagine that when CW was
new there were few authoritative manuals for generating the newfangled
continous waves either. And certainly the "spark forever" boys wouldn't
want to talk about it.

Packet really is new to the amateur world. Many of the operating techniques
and hardware standards of two years ago are now obsolete. Things are
changing too fast for an authoritative book to be meaningful. It would
be largely obsolete before it saw print.

The best sources of information are local groups and forums like this
one. There is as yet no national or international standard way of
doing everything with packet. Each local area is somewhat unique in
the way it sets up LANS, MANS, WANS, how it handles store and forward
traffic, what methods it uses for digital voice, what bands are used
for digital video, etc. With Netrom, Rose, Texnet, IP switched networks,
and plain old AX25 link level digipeating going on, often at the same
time in the same area, packet is still a fun *experimental* zoo. By
the time authoritive manuals and standards emerge, it will be time to
move on to something more interesting.

If you want to know how to setup a functioning distributed switched
56kb MAN, ask me. If you want to know about low speed simplex ROSE
links, ask someone else, I don't have a clue. In addition, what I
could tell you about 56kb MANs would probably differ dramatically
from the answers you would get from the Ottawa crowd who are going
in a somewhat different direction. The BBS crowd's view of packet
is totally different from those of us working on distributed
computing. The HF crowd is going in yet another, more traditional,
DXing and traffic handling direction. Packet Cluster folks are in
yet another world of DX spotting nets that happen to use packet
radio. Others, the spark forever crowd, are stuck in the obsolete
1200 baud digipeater world of keyboard chats. These last are the
only ones with a manual.

Rather than grunting "read the manual" most of us are at the "read
the source code, there is no manual" stage.

I'm building a transverter for 10m->70cm, to be used for the DSY-modems.
Transmit and receive seem OK now - haven't checked with an analyser yet -
but I have some problems getting the TX/RX antenna switch right.

Because it is going to be used for packet, I'm reluctant to use a
coax relay. So, I am looking into diode switches.
The amateur literature I have hardly mentions this area: transmitters
are described, receivers are described, but the integration of these
boxes usually isn't covered.
So, how to I keep my 25 Watts of RF out of the preamplifier stage?

I have looked into commercial designs, but most of them uses striplines
on PCB, which are hard to 'borrow'. Has anyone else struggled with this
problem? Somebody made a 70cm switch for 25W with kitchentable technology?
Tell me how you did it!

Thanks in advance!

No the information is correct. If you have a problem with trademark
infringement, talk to them. Also the Texnet folks. They've been using
those names for several years. They may have prior art on you. Or
they may not, I'm not an attorney. Regardless, those are the names
that they are using.

We have studiously avoided using the mailing lists/Usenet to advertise our
wares, but I guess it's ok to let you know that the Ottawa gang will be at
Dayton, and we should have some PI boards to sell. Looks like we will not
be at a table, so you'll have to catch us on the hoof, as it were. Good
possibilities would be at the packet forum on Friday, lurking in the vicinity
of the TAPR, AMSAT, or Grace booths, or at the infamous Saturday night
gathering at McNasty's. Watch for our, um, distinctive blue t-shirts. :-)

I know this is a FAQ, but when it came up the last time around, I was unware that I might be interested in the future, so I didn't save the thread. Anyway, please reply via email and I'll summarize for the net..

I'm within a day or so of getting the KA9Q TCP software running on my Unix box (but that's another thread) and am interested in finding out if there's a packet connection to the "wire" internet that will allow things like anon ftp via packet radio.

I'd also be interested in trading notes/comments/ideas/code with anyone else running the KA9Q stuff under Unix (specifically, in my case, SCO Unix SYS V).

Thanks in advance!

I have been using the NOS program on 144 Mhz for a while now and I would like to try to use it also on HF. The problem is that I don't know how to set the HDLC baudrate to 300 baud. I don't know how to set it to 1200 baud either but that must be the default. I think it must be a "param ax0 ..." command but which one? If there is a list of all the possible "param" commands I would like to receive a copy because I couldn't find any documentation about them.

  Last year, I discussed the idea of a packet-assembler-disassembler on rec.ham-radio.packet (now rec.radio.amateur.packet) which uses a SCSI link to the host. This is a project I've had on the back burner since then, mostly 'cause I wasn't looking very hard for data on SCSI interface chips. Now, while perusing some Zilog literature, I discover they offer a chip which combines the Z85C30 SCC (ubiquitous in packet radio) and the Z53C80 SCSI. The Z85C30 SCC is a very well known quantity; however I know nearly nothing about the Z53C80.

  Are there any readers who have used either the Z85C80 SCSCI (the combo) or the Z53C80 SCSI? I'd like to know about this SCSI controller, particularly any difficulties with the part or availability.

Thanks,
Dana

If that is not the required syntax for a posting a certain "Elmer" is
going to suffer the Wouff Hong.

I, and I presume others, would like some information on APLINK bulletin
board systems. They seem to be fairly common on hf Amtor and to be linked
with the national BBS system. I would like to know:
  * What is APLINK
  * What can it do
  * How is it linked to the rest of the world
  * Where can the software to run it be obtained (APLINK 5.03)
  * How is the frequency/band/beam heading scanning accomplished
  * Any other lurid details: Enquiring minds want, you know

Thanks: John WA9FCH McHarry@MITRE.org

I stand corrected -- to a degree. What I should have said, I guess, would

be something like ``this is the intent of hierarchial **addressing**''.

As you correctly point out, Internet host names are hierarchial but do not necessarily imply addressing. They do if and only if they point to a non-IP subdomain for mail traffic, such as fidonet.org, where routing is provided through UUCP to different gateways depending on a specified subdomain.

In the store-and-forward landline network Fidonet, addresses are hierarchial but numerical on the form

    NNN:NNN/NNN.NNN   (the punctuation allows for abbreviation only)

The Fidonet address is left-major, opposite the direction of the Internet and Amateur Packet hierarchial names, but partially similar to the IP numbering system (NNN.NNN.NNN.NNN).

If a system is to send mail to, say, 2:206/203.1 it uses an algorithm like this:

    [THIS IS VERY SIMPLIFIED AS ANYONE FAMILIAR WITH FIDONET WOULD SEE
     IMMEDIATELY]

    Do I have a route to 2:206/203.1?   No
    Do I have a route to 2:206/203.0?   No
    Do I have a route to 2:206/0.0?   No
    Do I have a route to zone 2?   YES - 1:115/500.0 -> forward

The amateur AX.25 network is different from Fidonet, Internet and UUCP in topology, nature of the nodes, the information each node has, and addressing format. Thus what applies to one does not necessarily aplpy to the other. That doesn't prevent us from learning from each other and find a good combination of techniques needed for each individual network.

                        /Peter

I need some assistance from any kind soul in mbox message forwarding.

I'm trying to setup a PC running KA9Q to forward messages to non-TCP/IP stations. Suppose I want messages for AH6BW to be forwarded to AH6BW@AH6BW-2 where AH6BW-2 is a different machine that doesn't handle TCP/IP.

In my /alias file I have:

ah6bw ah6bw@ah6bw-10

In my /spool/forward.bbs file I have:

```
----
ah6bw-10
ax25 ax1 ah6bw-10
ah6bw
----
```

When the SMTP timer kicks in I get a message about ah6bw-10 being an unknown host (as if it wants to deliver the message via TCP/IP and it fails on a hostname lookup). Shouldn't the entry in the forward.bbs file be enough to tell NOS that ah6bw-2 is NOT a TCP/IP station? What am I missing here?

I'm running the latest version of NOS from thumper.

Tony

Precisely. The WHOLE address needs to be taken into consideration when
routing. You cannot route to just "#WA". You must route to "#WA.AUS.OC".

>> VK6ZJM) should ONLY be considered for routing purposes if it is shown as part
>I think that when someone moves the first person they tell (in the packet
>world) is the SYSOP of their local BBS, otherwise that BBS is going to keep
>trying to forward mail to them when they're not there. Being able to forward
>on the TO field is often very useful - remote SYSOPs often like to have mail
>addressed to SYSOP forwarded on to them, for example.

Forwarding on the TO field shouldn't be enabled. The ONLY thing the TO
field should be used for is allowing the destination station (named in the TO)
to read his private mail. It certainly shouldn't be used for forwarding.
Most (if not all) programs allow remapping of addresses. If your remote
SYSOP (mentioned above) wanted to get his bulletins then they should be
remapped to SYSOP@<his BBS>.

Maybe things are different in the UK but here in Canberra I don't try to
forward mail to individual users. They log on to my BBS to read it. I
have 2 users who run PMSs who get mail forwarded and I have asked them to
detail their heirarchical addresses as;
(for example)
vk1mc@vk1mc.vk1kcm.act.aus.oc
and no other BBS except me has to have routing information for them.
(I also remap vk1mc@vk1kcm to vk1mc@vk1mc.vk1kcm.act.aus.oc as few
amateurs understand heirarchical addressing. :-( )

The TO field on Bulletins is another story. :-(It shouldn't be there
at all.

Carl.

     Yes, there is. I've written a program called PMP (Poor Man's Packet)
that is in use here in the Ithaca, NY area. The gory details of the serial
protocol are not as cleanly implemented as Baycom (my program hangs the
machine during RX and TX) and I don't have as many features as Baycom.

But overall, I think my program is much more cleanly implemented (overall structure, user interface, configuration).

Originally, I was going to make the program shareware. Now, with the usual lack of time, I'm giving it away as "guiltware"--send me what you think it is worth. I offer no guarantees; I may never get around to fixing bugs. But I will give you some help: full source code (Turbo C).

If there is any interest, I will make it available via anonymous FTP.

>>> Re PMP - A user's comments

An excellent program. I've been using it for about a year and it works well. Several other users down in this part of the world have been using it quite successfully too ...

One disadvantage (which apparently is shared by BAYCOM) is that you cannot upload/download binary files (no YAPP/XMODEM ...) support.

I've been using the second parallel port, but as the port address, the active bit and which level is active are defined in the config file (PMP.CFG) you should be able to use either serial or parallel port to talk to the modem.

The modem side is simply a 7910 based modem for 1200 baud.

These comments apply to PMP version 0.93. Andy may have released a later version.

Cheers

Giovanni ZL2BOI

   When I run KA9Q version 910308 on my XT clone, it works fine on a SLIP link
to my AT at 9600 baud. If I try an AX25 connect to a non-TCP/IP system, it
crashes after a few K of data has been received. I don't think it happens
on a Telnet session over AX25, but I can't test it due to a complete lack of
other stations here in Perth running TCP/IP (Philistines!). It certainly
didn't crash the one time I tried a Telnet to it from someone else's computer,
but I might have been lucky.
   Has anyone else experienced this?

.....Ron

A detailed blow-by-blow account of the 1991 TAPR Annual Meeting in Tucson
is available for FTP on tomcat.gsfc.nasa.gov in /public/tapr/blowby.txt
and on thumper.bellcore.com in /pub/ka9q/incoming/blowby.txt (until Phil
moves it to a permanent location). The file is about 64K bytes long, so
I decided not to post it. It's based on the notes I took during the
meeting, so it doesn't represent the official position of TAPR or anyone
else. Any mistakes are mine.

If you want to use some or all of the text in a newsletter or similar
publication, please do so. I'd appreciate it if you would give credit to
the SANDPAC (San Diego Packet Radio Association) Newsletter.

I hope this will be of interest! 73 -Paul Williamson, KB5MU

Some time ago, a European software package was announced that could
emulate a TNC on an IBM PC or PC Clone. Besides that package, are
there any other IBM clones TNC emulators around?

I bought a PK-88 a few months ago and am now ready to use it,
but I seem to have misplaced the manual. Can anyone tell me

the pinouts on the 8 pin tx/rc connector?

Thanks....Keith Erskine - KA1RHO

ps: I'm connecting this to an old Yaesu FT-22R 2M all-band. Any
special considerations I should know about? - thx ke

   This is the point I was trying to make in my original post. There IS such
a way, without adding anything. If you scan from right to left, with all fields
significant, then there's no ambiguity. To use your example, #WA.AUS is
obviously not the same as #WA.JAP, and any software that thinks it is clearly
brain-damaged. It's like telling someone that he can't call himself
"John Smith" because there's already a "John Jones" somewhere else in the
world, regardless of the fact that they're bound to have different higher-order
addresses (ie one lives in Sydney and the other lives in Oslo).

    1   Ground   Brown
    2   Mic Audio White
    3   Push-To-Talk Red
    8   Receive Audio Green
    7   Squelch Input Black (optional)

Using the provided cable, follow the colors above to match up with the
manual, when you find it.

By the way, I am reasonably computer literate, network literate and
radio literate and I wouldn't attempt to do much with this TNC without
the book. It's worth getting another copy from AEA, since the TNC is
loaded with commands and features.

SAREX Introduction

STS-37 Crew:
  N5RAW, Steve Nagel, Mission Commander
 KB5AWP, Ken Cameron, Pilot
  N5QWL, Jay Apt, Mission Specialist
  N5RAX, Linda Godwin, Mission Specialist
  N5SCW, Jerry Ross, Mission Specialist

SAREX equipment on this flight includes a 2m (144-146 Mhz) Motorola radio (output 2.3 watts), Robot 1200C slow scan convertor, Heath HK-21 packet TNC, a 70cm FSTV receiver, a video camera, and a Monitor/VCR. Planned operations

include voice contacts, packet robot, downlinking orbiter video via SSTV, uplinking FSTV video to the orbiter.

During sleep periods and when no other SAREX activities are scheduled the equipment will be left on in packet robot mode. If time permits the crew will setup SAREX to transmit SSTV using orbiter video cameras during the GRO satellite release and during the EVA. The GRO satellite release is scheduled for MET 2/03:00 (2 days 3 hours after launch) for 1 hour. The EVA is scheduled for MET 2/22:00 thru MET 3/05:00. With 5 hams on the flight there may be many unscheduled opportunities for operation, I suggest you monitor both downlink frequencies on all passes starting with orbit 1 until landing, even during sleep periods you could hear something other than packet. Contacts between the shuttle and school children will be retransmitted by W5RRR, see timeline for times, and W5RRR frequency information below.

SAREX Uplink/Downlink Frequencies

Downlink/Uplink Frequencies for Voice/Packet/SSTV to be used on Upcoming Mission

Get out your HTUs and HT programming manuals. You will want to program your 2 meter FM transceivers with the following information. Note that only stations with prior arrangements can uplink FSTV signals (special authorization is required from the FCC). It is expected that uplinking FSTV will require about 15kw ERP. FSTV ops and 2m can occur simultaneously.

Mode	Downlink Freq	Uplink Freq
Voice/SSTV	145.55	144.95 (primary), 144.91, 144.97
Packet	145.51	144.91 (primary), 144.93, 144.99

FSTV none 70cm band

Please note that the frequencies they will be listening for stations ARE DIFFERENT than the one they will transmit on. This is a very important fact to understand. They will transmit to earth (downlink) on a single frequency 145.55 MHz for voice and SSTV. They will listen for stations transmitting to the shuttle (uplink) on the other frequencies listed. This "split" operation is used quite successfully by DXers when operating in an environment where large pile ups are expected.

There will be no simplex operation with SAREX on either voice or packet. Although packeteers are not accustomed to operation with a TX/RX offset, in this case, it is the only way to connect to SAREX. If you transmit on 145.55 or 145.51 MHz the only people who will hear you are those other Hams in your area trying to hear the shuttle.

==========

SAREX Packet Operating Hints

FULLDUP OFF
DWAIT 0.1 - 0.5 seconds
FRACK > 3.0 seconds
C KB5AWP

The packet call sign on board the shuttle is KB5AWP (SSID=0). Your TNC should be in half-duplex mode (FULLDUP OFF) with CD active just like you do for normal VHF packet operations. If you can compensate for doppler shift it is worth the extra effort. The bandwidth of the SAREX radio is +/-4Khz, maximum doppler is around 3.3Khz. If you canUt compensate for doppler your best chance for contact is when the shuttle is at peak elevation at your site.

You should be careful with the setting of two of your TNC's timers: DWAIT and FRACK. DWAIT is the time interval after your Carrier Detect light goes out and before your transmitter turns on. You want to make sure your connects requests and ACKs are contained in the 3 second FUDtimer window. If everybody runs the same DWAIT (like the typical 0.1 - 0.5 second values used for terrestrial packet), then everybody will be transmitting at the same time. Part of the key to your success when uplink QRM is heavy is to pick a DWAIT that nobody else is using! (sort of like picking a lottery number!)

FRACK sets the time interval between your transmissions. After you send a frame, your TNC waits for the FRACK time, and then waits for the Carrier Detect signal to drop, then waits DWAIT, and then tries again. You should make sure your FRACK is at least 3 seconds so that you are not transmitting when the robot's FUDtimer decides it is time for it to transmit -- if you are transmitting at the same time, you will miss any packets the shuttle is addressing to you and you won't have a successful QSO.

Note that your DWAIT (how soon do I transmit?) and FRACK (then how long do I wait?) parameters and the need to stop transmitting so you can hear a reply

are just like you encounter when working a DXpedition pileup on HF. If the DX station has a pattern of listening for a few seconds (=FUDtimer) before transmitting, you may have better luck being the LAST station they hear, after the din dies down. The differences are that (1) the robot is a computer and is very predictable and (2) the robot can be working several stations at one time.

==========

Mission Audio Retransmissions

The following stations will retransmit the mission audio from the shuttle and ground controllers.

WA3NAN - Goddard Space Flight Center (GSFC), Greenbelt, Maryland.
W5RRR - Johnson Space Center (JSC), Houston, Texas
W6VIO - Jet Propulsion Laboratory (JPL), Pasadena, California.
W6FXN - Los Angeles
K6MF - San Francisco
W4MWG - Mebane, NC

Station	VHF	10m	15m	20m	40m	80m
WA3NAN	147.45	28.650	21.395	14.295	7.185	3.860
W5RRR	146.64					
W6VIO	224.04		21.340	14.270		
W6FXN	145.46					
K6MF	145.58				7.165	3.840
NASA/JSC	171.15					
W4MWG				14.230 (SSTV)		

==========

W5RRR Special Event Station

W5RRR - Johnson Space Center (JSC) ARC, Houston, TX. Special event station with bulletins, updated element sets, and current flight information will be making contacts and answering questions using SSB on the HF bands. The frequencies are listed below. The special event station will start after launch and run up thru landing. W5RRR will also retransmit the audio from the contacts between STS-37 and schools. Three of the 5 bands will be in use at any given time, band selection will be determined by propagation (usually 10/15/20m daytime, 20/40/80m night).

Station	10m	15m	20m	40m	80m	
W5RRR	28.400	21.350	14.280	7.227	3.850	(+/- QRM)

==========

W1AW Voice Bulletins

W1AW will be broadcasting daily bulletins with updated information on SAREX

during the flight. Voice bulletins are transmitted daily at 0230 UTC and 0530 UTC on the following frequencies:

Station	10m	15m	17m	20m	40m	80m
W1AW	28.590	21.390	18.160	14.290	7.290	3.990

==========

AMSAT Net Operations

Information will also be available from the AMSAT net, tune in for bulletins. The net operates every week on:

Sunday	1800-2100 UCT (international)	14.282 Mhz USB
Tuesday	0130-0300 UCT (USA)	3.840 Mhz LSB

==========

JSC INFO BBS

The Public Affairs Office at the Johnson Space Center operates a BBS to provide information to the public. Check this board for updates to the keplerian element sets during the flight.

To access the BBS, call +1-713-483-2500 using 1200 baud, 8-N-1, at the ENTER NUMBER: prompt, enter "62511" and you will be connected to the BBS. Check file area 30 or 99 for latest element sets.

NASA JSC's Electronic Space Information BBS is intended to provide 24-hour access to biographies of NASA officials and astronauts, news releases, space flight mission presskits and television schedules, space shuttle systems information, flight manifests and schedules, and other information about the space program.

==========

NASA Select Video Broadcast

The continental United States will receive NASA Select television, 24 hours a day throughout the mission, via:

SATCOM F2R
Transponder 13
72 degrees West Longitude
3960 MHz (Video)
6.8 MHZ (Audio)

==========

(Note:  Although less than a month has gone by, my list of volunteers
has nearly quadrupled.  Also, someone suggested that I add a list
of suggested areas of expertise.  So, here is the latest list...)

As part of the multi-pronged strategy of Project SAVE THE BANDWIDTH, I
will be compiling a directory of On-Line Elmers.  These are people
who, by virtue of skill and knowledge in an area of expertise in ham
radio, are willing to field E-mail by readers of the rec.radio.*
groups.

Volunteers need only send me their name, E-mail address, and area of
expertise.  As requested, here is a suggested list of areas of
expertise that are needed:

 1.  Volunteer Examiners
 2.  Novice Instructors
 3.  DX'ers and Contesters
 4.  QRP
```

 5. Homebrewers
 6. Packet Ops (both AX.25 and TCP/IP)
 7. VHF and Repeaters
 8. OSCAR and other satellites
 9. MARS (Military Affiliate Radio System)
10. CAP (Civil Air Patrol)
11. ARES (Amateur Radio Emergency Service)
12. RACES (Radio Amateur Civil Emergency Service)
13. Skywarn (Amateur Weather Spotters)
14. ARRL Field Organization (American Radio Relay League)

"Generalist" or "Miscellaneous" Elmers are also quite welcome.
Naturally, the more that volunteer, the more the work is distributed.
If upon volunteering, you are unable to meet your obligations, simply
write to me and I will remove your name from the list. I could also
add that because of "personal committments" or "career broadening" you
no longer are available to Elmer on a regular basis.

I will be the point-of-contact for this project. I will maintain the
list, post it to the groups at least monthly, and have the latest copy
placed in the supplemental archives at ftp.cs.buffalo.edu in
subdirectory pub/ham-radio.

Here is the latest version of the list. If you sent me mail and are
not on it, please resend as it may have been lost on the way or once
it reached my host.

O.k. I finally got Net/Mac2.1d3 running reliably on the Mac SE. So I
go to make some connections with other stations I can "hear". Problem
is they can't hear me (at least directly). Now there is one station that
I can hear and he can hear me (wn6i-7, 44.4.0.96). I can telnet
to him, ftp, etc. But now I want to telnet (or ftp) to another
station in the area. For example, kg6kf (44.4.0.164). Now by looking at
the trace of packets on the air, I note that kg6kf can hear wn6i-7, and
vice versa. So I do the following commands:

arp add [44.4.0.164] ax0 kg6kf wn6i-7
route add [44.4.0.164] ax25 [44.4.0.96]

Then try telnet [44.4.0.164]. What happens is that wn6i-7 forwards
for me and kg6kf (44.4.0.164) sees my syn. kg6kf then sends out a arp
request for my ip address (44.4.2.137). I see this ip address and send
an arp reply. The problem is that my reply goes directly to kg6kf, and
he can't hear me. So the question is, how can I get arp to send to
kg6kf via wn6i-7 instead of replying directly?

It seems that this should be doable without have to change the routing
table (using arp and route add) on kg6kf. If not, then everyone has to be
able to hear everyone else; and only direct connections would be possible.

Thanks

I haven't found a way yet. :-(I have a similar problem here in Canberra.
Hidden Transmitters are the norm. The only solution we have come up with
is to have every station you want to talk to that isn't direct pointed to
by a route and/or arp entry and they also have to have you defined.

We have another problem here in Australia. IP routing isn't legal over the
air. (Yet, we're trying) To talk to stations out of line of site we HAVE to
use digipeaters. :-(Usually we end up having all the people we normally
talk to defined to ARP with a digipeater chain. :-(

Carl.

You might try adding the following "route" entry:

ax25 route add kg6kf wn6i-7

That's what I had to do to get to a local tcp/ip station thru a digi.

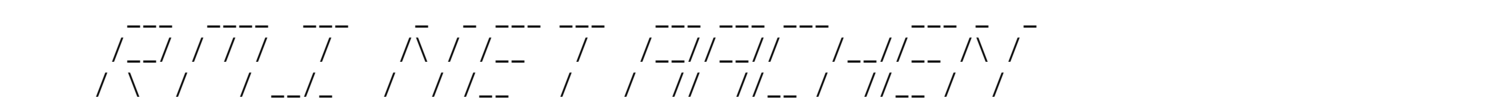
This version like to hang on several oportunities, f.i.:



If you "record" an ax25 session and disconnect before you "record off"
nothing happens, even <CTRL><ALT><DEL> does notwork.
Resolving of well known addresses takes longer than with earlier versions.
Some SMTP session tend to hang.

If have seen some references in posting to the use
of the Casio BOSS as a terminal. Would someone
please inform us as to how this is done?

What does one do to the BOSS to put it in terminal mode?
Baud rate, parity, etc.?

Finally - how successful is this process? Does the size
and portability of the BOSS outweigh the disadvantage of
the small screen and miniscule keyboard?

I am interested in retrieving e-mail and accessing packet

bulleting boards while on the road. File transfer is of
little interest to me.

Any comments?

thanks,

***** 50 cent buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS

FLEA all SUMMER at MIT
Sunday, April 21, 1991
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take place on the third Sunday of each month this summer, April thru October.

There is tailgate space for over 400 sellers and free, off-street parking for >1000 cars!

Buyers admission is $1.50 (you get 50c off if you're lucky enough to have a copy of our add) and sellers spaces are $8.00-each at the gate or $5.00 if mailed by the preceding 5th. A sellers Season Pass for all 7 sundays is available for $28 if purchased by April 21st

The flea will be held at the corner of Albany and Main streets in Cambridge; right in the Kendall Square area from 9AM to 2PM, with sellers set-up time starting at 7AM.

!! RAIN or SHINE !! Have no fear of rain, a covered tailgate area is available for all sellers (6'8" clearance).

Talk-in: 146.52 and W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)

>

It sounds like it went back to AFSK and the bootloader. They are probably
reloading code from scratch.

Bob

UO-14 was back to normal by the following day. I was able to download
a few msgs describing what was going on:

Create-time: Mon Apr 01 06:19:37 1991
Source: g0k8ka
Destination: all
Title: Reloads and Outages.

Harold Price (NK6K) is temporary hostage at UoS, and we have been doing some work on FTL0 and the other UO-14 software. A lot of changes have been made since January, when we last reloaded.

Reloading and testing may start tonight (01/04/91) UTC, so expect some interruptions to service and perhaps loss of the file system. Sorry.

Title: UO3 DOWNLINK SWITCHING
Keywords: UO3

** QUICK STATUS REPORT **

Do not be alarmed by the sudden "disappearances" of UO-14's downlink; it is actually switching onto another frequency to send a few packets. When the spacecraft is idle (no broadcasts or FTL0 connections), the switch will take place every 25 seconds and 5 seconds of packets will be transmitted on the other downlink frequency.

A full report on the "how and why" of this switching will be forthcoming.

JWW
Create-time: Thu Apr 04 06:27:03 1991

Title: DOWNLINK CHANGES
Keywords: UO-14 FTL0

UO-14 Downlink Changes

>From 1400 UTC today, UoSAT-OSCAR-14 started switching its single downlink transmitter between its Amateur Satellite Service frequency (435.070 MHz), and an experimental UHF downlink frequency licensed outside of the Amateur Satellite Service. Amateur users will sometimes see the downlink "disappear" for as little as 250 msec or as long as 5 seconds. So long as the downlink eventually returns to 435.070 MHz, there is nothing wrong with the satellite.

UO-14's can operate outside the amateur service to support experimental communications trials to and from stations in developing countries. Most of these trials will be conducted by The Volunteers In Technical Assistance (VITA). VITA is an international development organisation with long-standing ties to AMSAT and UoSAT. VITA funded the construction of the UO-11 Digital Communications Experiment (DCE) by AMSAT volunteers in the USA and Canada, and contributed to the development costs of the UO-14 PACSAT Communications Experiment (PCE) hardware and software. It was, in part, UoSAT's arrangement with VITA which allowed G0/K8KA time to write FTL0 and the file system software now running on UO-14, PACSAT and LUSAT.

VITA will be using UO-14 to transfer technical information amongst a number of stations in developing countries. These stations will be in areas which are poorly served by existing data communications systems. VITA's UO-14 operations are an experimental pilot system which will allow VITA to pass traffic which might not be appropriate for amateur channels. The UO-14 pilot studies will help VITA determine whether or not to purchase its own dedicated satellite. This operations are licensed by the FCC in the USA and by individual national authorities in other countries.

It has been common for the RS series amateur satellite transponders to ride on the satellite bus of a non-amateur transponder or instrument; VITA's "hitchhiking" on UO-14 is similar. On a microsatellite like UO-14, however, the distinction between amateur and non-amateur payloads is blurred, and unique resources such as the downlink transmitter, the RAM message store and the CPU are actually shared.

This symbiosis benefits both the amateur satellite community and the non-amateur organisation. Through collaboration with non-amateur organisations, the amateur satellite service conclusively shows its value as a force for technology development and testing. This, in turn, should help to secure our frequencies against competitors. On a more basic level, transfer of technology to paying customers helps fund present and future amateur satellite missions. These commercial (if not profit-making) ventures keep organisations like UoSAT, AMSAT-NA and TAPR financially sound so that they can continue to pursue technical goals with benefits to the amateur community.

This change in UO-14 operations was made possible after NK6K travelled to the United Kingdom as a volunteer courier - carrying solar panels for UoSAT-F. NK6K and G0/K8KA took advantage of this brief visit to add a new WB6YMH I/O driver and to change QAX.25 (the software TNC), the broadcast protocol, and FTL0. In orbit testing started on 2 April.

As the testing dual-frequency operation on UO-14 continues, we will issue further technical and "administrative" updates.

I am curious if there is a way to send messages out to a packet BBS in Tennessee from my QTH in california.

The real trick is this: I don't have packet equipment. I would like to use some sort of gateway machine that is tied to the national INTERNET or BITNET.

I will be pleasantly suprised if such a thing exists, since whoever allowed messages to travel from the INTERNET onto the airwaves would have to take some sort of steps to insure they came from a liscensced amateur...

I grabbed 1.1.7b from TOMCAT a couple of weeks ago and installed it in a TNC-2. It seems like the old param ax0 255 0 command won't return you to cmd: mode. In one case it locked the TNC.

Has anyone else come across this? Is there another way to return it to cmd: mode?

Carl.

   I haven't looked at the KISS code in 1.1.7b yet, but in the earlier versions of KISS the command should really be "param ax0 255 1". The second parameter should be non-zero. (Some earlier instructions would have us enter "param ax0 255", but whether this returns to AX25 mode or not depends on the first character sent after the "param ..." command). I have used 1.1.7b here for a couple of months (well, it seems that long), and it's not given me any problems.

Re: Proxim Address

Proxim Inc,
295 North Bernado Ave
Mountain View CA 94043
415-960-1630

According to my spec sheet, they sell 4 spread spectrum radios:

RXA-100	Serial Intf	121Kbps	100mW output
RXA-1000	"	"	1W
RDA-100	Serial/Parallel	"	100mW
RDA-100/2	"	"	242Kbps 100mw

Their evaluation kits go for $2000 which includes 2 radios, 2 Engr test boards (RS-232 intf, switches for channel selection etc) and 2 antennas. By channels they mean separate (1 of 4) spreading code selection.

Help. Our Wisconsin Frequency Coordinator would like more input on what frequencies are being used for WA4DSY modems. I think it's important to plan the use of the spectrum while we CAN! So, anyone with input on the topic (especially the Ottawa folks), please post the frequencies allocated or proposed in YOUR area. Also please CC: pat@pgd.adp.wisc.edu 128.104.198.22, as I am WAY behind in my forum reading.... Try an list out freq's in at least 220/432/905 areas..

Tnx a million,   Pat

P.S., I need this YESTERDAY :-).

If you've got a moment, consider the following...
Could the unique capabilities of packet be exploited to create
an enhanced transmitter hunt?
As Matt used to say, "I'm not sure what I mean, so I'll listen to
what I say." So, forgive me if I ramble.

- perhaps bearings (taken by some contestants) would be posted to a BBS (or something like DX net) to be shared by *all* players. In this manner, even those bound to their living rooms could play, with a Diet Coke in one hand, and their parallel rulers in the other...

- points could be awarded at the end of play, not only for finding the transmitter (those lucky mobile guys!) but also for posting good bearings.

- If we do a little pre-game work, and build a table of call and physical locations, then the fixed stations could just as easily contribute to play.

- Should the transmitter being hunted just emit a beacon? Could the beacon packet contain hints? (or a goose chase?)

- <your ideas here...>

Gotta go, my girlfriend wants to go to lunch...

No such devices have been built by THAT name in most of
a century. Any of the '60s vintage Radio Amateur Handbooks, though,
will have 'grid-dip meter' construction articles, and a grid
dip meter is exactly a TRF receiver (not terribly sensitive, though,
as they usually leave out the preamplification). After mid-60's,
the grid-dip meters used MOSFETs (what's a 'grid' in a MOSFET?).

Neat ideas! How about being able to 'ping' the fox with a high-speed
packet radio and measuring the round-trip delay to get range and bearing?
Yes, it requires both ends to have very quick turnaround (or split-band),
but it can't be _that_ difficult...

Could you, Mr. Whitmore, please refrain from crossposting your article to
all of rec.radio, and could you, Mr. Sumperyl, take a look at what groups
you`re following up to and modify them so that they're appropriate? I
mean really, who in rec.radio.cb would have a schematic for a tube TRF
reciever?

And why in misc.forsale, let alone rec.radio.cb??

> Can anybody supply me with a schematic for a tube TRF receiver?

There's an outfit called Lindsay Books in Illinois that sells lots of
vintage books. They've got two catalogs, one focusing on machine and engines,
and the second on electronics. Get the catalog for "old-time" electronics
books - I'm sure you'll find something in there that is exactly what you need.

The Sparcstation1 has an 8-bit PCM audio port. Has anyone thought about using
that port to implement some low-speed DSP modems? I suspect that the

SPARC has enough guts to do this, but I'm not enough of a DSP-dweeb
to know for sure. Has anyone made an attempt?

Actually, it is frequency, not code. There are 7 channels, 4 that
claim to be non-overlapping, and 3 half-channel spaced ones between
them. The frequencies are listed in one of the manuals, as I recall.

Can anyone advise me where I can get a copy of TheNET 1.16? I got a copy of it
off of TOMCAT, and the code acts weird, so I got a copy of Le NET2 which was on
the K4NGC telephone system. It too is buggy. Is this code all bugs? If so are
there any revisions or later versions? Had nice features like reconnect to the
last connected node, a quit from far end, and was setable to either a open end
user system or closed backbone tunk. TheNET Plus 2.06 isn't configurable as
much as 1.16, but since it was buggy, went back to 1.0.

After mid-60's, the grid-dip meters used MOSFETs (what's >a 'grid' in a MOSFET?).

Well, in fact the 1963 Radio Amateur's Handbook has schematics for single-stage tube TRF receivers; you would just build a detector stage (plate detector, infinite impedance detector, or grid-leak detector) and wire the antenna to the RF input. You could then add an RF amplifier, if you wanted, remembering not to cheat and do any conversion stages ;-).

As for no one building a TRF receiver in most of a century, check out the Ferranti ZN414 AM Receiver chip (available from Circuit Specialists and a couple of other places). It's a 10 transistor TRF receiver (4 amplifier stages, detector, and AGC) built into a TO-92 transistor package; add two resistors, two bypass capacitors, an LC tank, and an audio amp, and you have a complete receiver.

(The 1963 Handbook also has a 110 page advertisement section that will make you CRY -- MAYBE a quarter of the advertisers still exist)

Spring 1991 Status Report of Hubmaster and Intermediate
Speed Network Development in Northern California.

This is an update of some of the recent moderate speed amateur radio network developments in Northern California already described in the 9th ARRL Computer Networking Conference proceedings, QEX Magazine and elsewhere.

As previously stated, our efforts are not only toward providing faster hardware and link layer operation but to more efficiently use amateur radio resources to provide amateurs with network layer access at moderate speeds. We anticipate that this will greatly improve current amateur radio applications and also provide a platform for completely new ones over wide areas. We hope that many "non-digital" amateurs will find the services such a network can provide to be both interesting and personally useful. We also hope that "non-radio" individuals with computer and networking interests will discover amateur radio as a wonderful environment in which to pursue their interests.

Doing all this requires new radio hardware and digital hardware to handle the .25 Mbps to approximately 2 Mbps data streams. Economical operation at this performance level requires line-of-sight radio links. Hardware and new protocols which effectively utilize it are being devised. We have developed an architecture which allows small groups of amateurs to share both the expense and performance in a manner similar to current NBFM repeaters. One of the goals of this moderate speed solution is to solve the hidden transmitter problem without requiring users to suffer the additional complexity and expense of full duplex radio hardware. We have found AX.25 not to be sufficient for these goals. Perhaps most importantly, new kinds of coordination and cooperation among amateurs are becoming necessary to successfully implement all of this.

System Components

At present the intermediate speed radio hardware includes 900 MHz, 256 kbps 10 watt radios along with 13 element yagi antennas and a commercial colinear antenna for use at the hub. See the Hubmaster paper in the 9th ARRL CNC and March 1990 QEX/Gateway for details. Interface hardware to connect the radio(s) to the digital i/o is also necessary. Some of the 256 kbps radios along with the previously described 2 Mbps microwave link hardware may be used on initial backbones.

The digital interface, MIO ("Mundane" or "Multi-function" I/O), can plug into a user's personal computer or be run standalone (remotely) as a hubserver and multiport switch/router to the backbone and other clusters. MIO has up to 4 SCC ports capable of driving a great variety of radio or wireline hardware. It is capable of emulating a conventional AX.25 TNC on one port while it serves a 1Mbps microwave backbone connection and a cluster of users running Hubmaster protocol at 256 kbps on other ports. A "stripped down" version of MIO can be run as the interface between the user's computer and 256 kbps radio.

In order for all this hardware to operate together considerable software is necessary. This includes a packet driver for KA9Q NOS, Hubmaster primary and secondary software along with a software development toolkit

including debugger. Provision has been made so that software can be written in C++ and put into ROM or loaded into RAM either via over-the-air transfer for the remote case or through shared memory to the PC in the plug-in case. The toolkit will provide basic interface to the Hubmaster polling protocol allowing developers to port their own protocols into the environment. If Borland C is used, then S/W debugging can be done via the TD/TDREMOTE interface.

Status of Individual Components

Radio Hardware, N6GN

For several months two 10 watt radios, a prototype and a "pilot" unit, have been complete. A bit error rate tester was designed and built and BER and multipath distortion measurements have been made on-bench as well as across a variety of real paths from 50 feet to 7 miles using the first two radios. A quantity of commercially fabricated printed circuit boards have been made. One radio using the commercial boards is now virtually complete and working. Major parts for building 12-15 units are on hand. The intent is to build approximately 6 more radios for immediate deployment by N6RCE in Hubmaster protocol development and by N6GN for inter-cluster backbone communications.

13 element 5' boomlength yagi antenna have been designed, built and measured. Performance is within a few tenths of a dB of expectations. A commercial omnidirectional colinear for hub use is being evaluated.

Interface circuits which provide logic level conversion between the radios and MIO are completed. Additional interfaces with provision for external clock/data encoding and decoding are in progress.

Digital Hardware, N6RCE

The basic MIO PC card has been completed. Ten boards have been commercially fabricated. Two of these have been loaded and the hardware completely debugged. Software development is proceeding. Additional boards are being assembled.

MIO is designed as a full length IBM PC plug-in adapter. The card sports a V40 microprocessor running at 8MHz, 768K DRAM, up to 256K EPROM, and a pair of ZILOG ESCCs. It is designed for 8MHz (ISA) 8-bit slot PC buses but will function in any AT slot.

MIO can function in any of three ways; entirely standalone, only drawing power from the PC or it can interface with the host processor. Interface is via a shared memory window. The size can be either 8K or 64K. The shared memory window address and size are set by writing to a control I/O register. Possible base addresses for the window are C8000, CC000, D8000, DC000.

This control register also allows the host PC to generate interrupts to the V40, and to program the IRQ line used by MIO to interrupt the host.

The V40 is an integrated microcomputer containing an interrupt priortizer, four DMA channels, and three timer/counters. The DRAM refresh controller and external bus arbiter for sharing DRAM with the host PC are also utilized.

Software, N6RCE

A software toolkit supports development and debugging with Borland C++ V2.0. A complete operating shell is supplied including linking, relocating and loading of code written on a PC platform.

A run-time kernel provides for TOD keeping, interrupt management, DMA management, buffering, protocol manipulation and easy access to the Zilog ESCC (give us your buffer, we'll get it there).

The programmer will be able to write software on a PC platform, compile and link on the PC with Borland TC++, load it onto the adapter, and debug it with the remote debugger supplied with TC++. (TC++ has a facility (TDREMOTE) which allows the target program to be debugged to run on one PC and the debugger to run on another PC. The two debuggers communicate via a serial link). This feature provides the possibility of remotely developing software running on hardware located at distant sites such as Hubmaster hubs or hilltop backbones from the comfort of a home QTH.

System Status, Timetable, Targets and Priorities

All development is currently being performed and funded by N6RCE and N6GN. Limited personal resources have set the speed of progress. We hope as hardware and protocols come on-line in Northern California that others will step in to develop applications. Such applications are becoming increasingly important to the furtherance of the project. We also hope that hardware will become commercially available for use by others outside of Northern California to start developing and enjoying the benefits of higher speed user network access.

Current emphasis is on getting a minimal hub and backbone operating in time for the next ARRL Computer Networking Conference at San Jose, CA in September. Deployment of one or two clusters along with an interconnecting 256 kbps backbone is planned. To accomplish this, Hubmaster protocol refinement and backbone hardware/software development are running in parallel at N6RCE and N6GN, respectively.

Future Targets and Checkpoints

Future directions all rest on the completion of a functioning hub and backbone. Once this is accomplished the number and variety of options is very large indeed.

Additional radios on other 900 MHz and 1200 MHz channels will need to be deployed to allow multiple physically close clusters to coexist. N6GN anticipates first modifying 900 MHz radios for 1200 MHz operation and then

building all future radios in the 1200 MHz band. A minimum-expense combination low power user radio/interface ("layer 3 tnc") is anticipated with the goal of further reducing the cost of user hardware. N6GN hopes to have an opportunity to apply some ideas to substantially improve the cost/performance of microwave backbone hardware.

In Northern California we hope to add additional clusters and to extend the backbone so that the Bay Area, Santa Rosa, North Coast and Sacramento users all have higher performance connectivity.

Clearly these directions and opportunities require the cooperation and efforts of many people with many different talents. We hope that as others see functioning hardware and protocols along with available development tools that they will join in building and extending the network both in expanse and services.

Since the function of the network is to support new and improved amateur radio applications we hope that many new ones will emerge. Existing BBS traffic and possibly DXPSN traffic may be supported. We hope that wider area connectivity will evolve. The SF Bay Area to Southern California path is one early possibility. NNTP, "News" protocol, client and servers are already in use at lower speeds and this network should be much more able to support Usenet style distribution of dialogue and information to amateurs over a wide area.

Many other applications including amateur FAX, voice mail, digital voice and a NBFM to IP gateway, to name a few, are being considered.

Where to Find Out More

Since this is just an update on our recent intermediate speed networking efforts we refer you to December 1989 Ham Radio Magazine, the 1991 ARRL Radio Amateurs Handbook, March 1990 QEX/Gateway and particularly to papers in the 8th and 9th ARRL Computer Networking Conference proceedings for details of our approach and what we are doing.

I'm a new (brand new, still waiting for my ticket) ham and I'd like to
get into the packet business - I've got an HK232 with the mailbox upgrade, and
an ICOM 24AT. So far, I've got 'em hooked together and talking to a
dumb terminal program, but I understand that there are lots of additional
"goodies" out there. Can kind soul get me started?

Things are complicated a little bit by the fact the the computer I'm using
as a terminal (or more?) is a Unix box, running SCO Unix (SysV) 386. So,
I'd appreciate specific pointers to available Unix software (I can run
DOS under Unix if I have to).

Thanks!

Can anyone explain the waveform generation of the g3ruh modem? I am
interested in understanding the encoding in the EPROM in the hopes of
hacking with it.

As I understand it the upper 4 (or 5) bits are just selecting the
waveform. I don't know that the purpose of putting 'data' on these
lines is for but the jumpers have that position.

I have dumped my ROM (PACCOM 1.0) and can see patterns in the data but

haven't been able to figure it out yet.

Any help apreciated. Email and I will summarize.

One of the local amateurs here in Adelaide has had a play
with BayCom and found that if you enter callsigns beginning
with V with two V's as follows,

CONNECT VVK5TTY for example

the program drops the first V but will pick up the second.

Thanks also to brian G1NNA for confirming it was a bug.

I would be interested also if someone could tell me if there
is somewhere on the net where the original documentation
in German is available? There are a couple of amateurs
here who are interested in the original aswell as the

english translation. (I have the english copy, the
german one I havent found).

      I am having some problems with interfacing a DRSI packet adapter
type 1 and a G3RUH 9600 bps modem. The problem is the tx-clock.
On pin 15 of the DB-25 connector I can get 32 x clockrate, but the
G3RUH needs 16 x clockrate. Of course, I could put in a separate divider
etc.,etc., but I am wondering if there is a easier way...?? Adding
some jumpers on the DRSI board perhaps ??? The SCC is a Z8530. Anybody
got some closer info on this one?

     Also, a minor problem, how does one change the rts (Request to Send)
signal to real Push to Talk (0V -- 12 V). I am using ttl levels on the
DB-25 interface, so I now have 0V -- 5V. Any easy solutions?

I recently purchased a TAPR TNC-2, version A (the TNC-2 with only 4 LEDs and no PTT LED), but it didn't have the schematics, even though it did have the assemble manual. After contacting TAPR, they no longer keep that schematic in stock. If you have a schematic for this unit, I would be happy to pay shipping and copying costs.

I am interested in anyone's experiences in modifying and OPERATING
commercial and ham equipment to operate 4800-9600 baud packet.

This question is concerned with modifying FM radios for terrestrial links,
not satellite work through SSB equipment.

In particular, I'd like to hear any experiences with setting up the radios
and what performance figures are being seen (like dBm for 10-6 BER,
bandwidths for various baudrates, deviation values that worked, radios
that worked better than others, etc.)

I would like to try to use the older rock-bound commercial gear like Micors,
Maxars, MASTR EXEC's, etc.

Email is fine, I will summarize and re-post what I hear by that means.

Thanks,

Ron Luse, KD9KX

I have been modifying several of these kinds of radios for 9600 bps
operation recently.

The MASTR Exec-II won't do it easily; it's got a phase modulator and
won't do flat dev. The receiver works fine, so we'd thought about

shoving the modulation into the temperature compensation voltage line
to see if we could move the tempcomp varicap around to get true FM.
That might work, but we never got around to trying it.

The old lowband Mocom-70 will work at 9600 bps, but our experience is
that you really need to use them at 4800, because they have enough
frequency drift that the IF might wind up shaving off the edges of
received signals if one end is drifting opposite the other.

The MICOR will work just fine on 450 MHz, since there is a direct-FM
modulator on the TX offset oscillator. The highband and some lowband
models have phase modulators, which won't work, and the serrasoid
modulator on lowband is hopeless. I did have success in using a 450
channel element in a highband Micor TX, and shoving the modulation into
the AFC input of the element, but it wasn't real clean. All bands have
plenty of receive IF bandwidth.

The Maxar is ideal because its transmitter has a direct-fm varicap
modulator. You just pop one end of the 10uF DC blocking cap off and
feed the modem into there. The receiver has sufficient IF bandwidth
but the detector is loaded down by the deemphasis network that hangs
off pin 6 of the detector chip; just chop off the 2.7k resistor and
take the output directly from pin 6 to the modem.

The Mitrek is pretty much the same as the MAXAR except that you have to
feed the transmit modulation directly into the modulation input line
for the channel element, since the previous stage is part of the
splatter lowpass filter. We'll be using Mitreks on the hill since
they have a much better front end than the Maxar does.

Hope that helps.

Has anyone looked into the feasibility of creating a digital repeater network?
It seems to me that this would allow most any ham to talk to most any other,
anywhere, using a simple handheld radio. This seems like a logical extension
of the current plans to create an analog system using dynamic links to a
long distance backbone. The problem with this scheme is: what happens
if a link in the backbone fails; and if more than one user wants to use the
system at the same time? It would be a very resource intensive system,
anyway.

In short: why couldn't the Amateur community set up the equivalent of a
digital cellular network with modest user requirements, linked exclusively
by radio and therefore immune to damage to the hard-wired systems such as
the telephone network.

Phil: can you hear me?

Since not all PBBS's run identical software, I would suggest you send
a message to the SYSOP of the board asking your question. Two other
ways that ALWAYS work are:
1) Send your escape char and then a 'd'. This will disconnect your
   TNC and eventually the BBS will abort from too many retries.

2) Turn down your received audio and eventually (depending on the
   number of retries allowed by the BBS, it will abort from too
   many retries.

Hi Clay and welcome to Ham Radio and Packet. I run packet with
little more than a terminal program on an old CPM machine and it
works fine. One thing you will need is some local help for finding
```

your local BBS on packet; equipment set up; etc. Thats a little
tough to do here. Once on the air, you can connect to the local BBS
and send messages all over the world. Most BBS's have a help file
that will describe the commands. While connected to any other packet
station, or even to your own mailbox, your computer works as a
terminal, so I would n't worry about operating system. Just have a
terminal emulator program available. You can work up to a dedicated
package like LanLink (which is for DOS) later.
By the way, when you get running send me a note. My call is N0JCG
and my home BBS is WA0CQG. You would address a message to me at
N0JCG @ WA0CQG. I think you'l like packet. I QSO with England,
Greece and Israel regularly with it.

I am planning a cross country expedition (by *RAIL*) and would like
to take along my packet radio system. I have a couple of issues I'd like
to discuss:

DUMB TERMINALS (or, 'Why is this lap-top so heavy?')
My girlfriend agreed to loan me her laptop computer (bless her heart)
but it just HURLS RF at 145.01 MHz. In addition, I'd just use it to run
PROCOMM anyway. (It weighs more than my entire packet setup!)
So I was at the mall this morning and saw something that
I found intriguing (as Cmdr. Data would say). Have you seen the Casio
B.O.S.S. model SF-9500? or model SF-800? These are little clock, calendar,

memo, telephone number, rolodex, scratch your back, do everything hand-held
LCD display things with little alpha-numeric keypads... and guess what...
There's a serial port on the little guy and the literature states that
"you can hook it up to your PC..."!
Has anyone heard of any sort of modern little hand held LCD thing being used
as a dumb (RS232) terminal? I'd only need a couple of lines (with scrollback
perhaps) and I'd let my TNC do all the work.

In closing, the other issue I was concerned about is...
Should I even bother attempting to try 2 meter work from within a
huge steel rail car moving at 80 mph? I love trains and have traveled coast
to coast more than 10 times (I don't fly), and I have met other hams aboard
the train with their HT's by their side. What do you think?
All aboard!
David
their HT's on their belts

I am looking for the schematic for the circuit as described in
the "BAYCOM" documentation.

I realize that there are boards available for the DIGICOM version,
but this requires an external power supply.

The circuit for the BAYCOM gets power from the RS232 port to power
the board. The documentation suggests sending 89 Deutch Marks
to an adress in Germany, but I don't have a readily available
source for the Deutch Marks and I don't think that I want to send
cash (even German) thru the mail.

I don't know how else to send for it or how long it would take
if I did find a way to order thru Germany.

Does anyone have a copy of the schematic for this circuit or

suggestions on how to order it?

I had the idea of connecting tha cable from my BOSS into the speaker
jack of my IC-24, put a NOS prompt on the screen and send it in to QST
as portable packet.

The answere to your question is: no. The BOSS will transfer data to
another computer running the appropriate software with a simple Intel
Hex based protocol. There is no "terminal mode" although I bet Casio
could sell a few more BOSSs if they added one.

The BOSS is a really neat and useful device although the only amateur
radio uses I have found for it are alternate time (GMT) and saving
repeater control codes and frequency information for reference.

I've been experiencing an odd problem with my packet station. Basically,
my screen gets cleared by the transmissions of other stations. The problem
developed as follows:

I bought a MFJ 1274 TNC and hooked it up to a XT clone using Procomm.
Everything ran fine. Decided to free up the PC by getting a dedicated
terminal for packet. Borrowed a Lee Data (don't remember the model #)
terminal from a friend, which ran in VT200 emulation mode. Found that
the screen would get cleared everytime my TNC tried to display a packet
from a local node (SFO on 145.01 in the SF bay area). I connected to
this node and found that any option I chose would result in a cleared
screen.

I didn't worry about it too much considering that the terminal was a
loaner. Well, this past weekend I went to the Foothill College swapmeet
and picked up an old Televideo terminal (TVI 321???). Fired it up and
found that it too would get its screen cleared by the same node. In
addition, I found that the character used to indicate the end of a
message on mailboxes (ctrl-z), also clears the screen of the Televideo
(ctrl-z didn't bother the Lee Data).

I understand that I can set the TNC to filter out specific characters that
are incompatible with the terminal in use. Obviously ctrl-z is one of them,
but I need to find what the other "clear screen" character is. Any idea on
how I should go about this? (I've asked another packet operator to see if
he get's any "unusual" characters from the node in question. He reports
that he doesn't see anything out of the ordinary when he connects to this
node.)

While using hierarchical addressing on the packet network, what is
the use of the pound (#) in the address. An example would be:

KB0AGD @ K0VAY.#NEKS.KS.USA.NA

I realize that #NEKS means North East Kansas, but what is the #
for? A flyback from the days of early sub-netting?

>of the current plans to create an analog system using dynamic links to a
>long distance backbone. The problem with this scheme is: what happens
>if a link in the backbone fails; and if more than one user wants to use the
>system at the same time? It would be a very resource intensive system,
>anyway.

I have thought of this idea. With current A/D and DSP technology, it
would be easy to build a fully Digital Audio Repeater (DAR). Just convert
the received audio with an A-to-D, add filtering/CW tones/ect
with a DSP and spit out the result using a D-to-A. If
output to a network is wanted, just send the digital streams
to a RF modem as well as the transmitter. Also, voice mail could
easily be implemented with the addition of secondary storage. (it could
even be transferred as normal mail over conventional packet channels.)

>In short: why couldn't the Amateur community set up the equivalent of a
>digital cellular network with modest user requirements, linked exclusively
>by radio and therefore immune to damage to the hard-wired systems such as
>the telephone network.

A similar 'what if' was presented at the _9th Computer Networking Conference_
by Jon Bloom, KE3Z. The technology is getting there, but it will take
even more time before the idea catches on. We have a large base of
old technology voice repeaters that will not go away. :-)

The # (sharp, octothorp, hash, pound, etc ad nauseum) means that the "regional" name following is a non-standardized one, as if the others were more standardized. In particular, it means that it's a more localized routing indicator than ones that don't have the # in front of them, and can be skipped without error if the station attempting to route doesn't know what it means. (I.e., if you don't know what #NEKS means, you may unhesitatingly skip over it and attempt to route at the KS.USA.NA) (Note that the TELLUS.SOL.MW is implied in this address and need not be supplied.)

Do not confuse these with the Internet hierarchical domains. They don't have any thing to do with the DNS, despite their identical format. Grr.

Some PBBS's do (and all of them *should*) support an A [Abort] command.
Examples include MBL and FBBS. You should be able to get a summary of
the available commands easily, to find out. There is always a delay
before the command takes effect, due to buffering at the PBBS, and frames
in transit if you're connected via nodes. Disconnecting to abort is
crude, but effective - but the suggestion someone made to render your
TNC deaf so that the BBS will retry out is, well, bizarre.

This is an excerpt from documentation provided with AA4RE's BB
bulletin board program:

"W0RLI, VE3GYQ, and N6VV have devised a scheme called hierarchical
addressing. Here's their description of their idea:

(stuff deleted)

"As an example, say that we send something to W0RLI @ W0RLI.CA.USA.NA,
and that the only entries that we have in the forward file are for
CA. That match would be sufficient to allow the message to be forwarded.
If W0RLI were found, that entry would take precedence (because
it is more left in the field than CA) and would of course also
ensure delivery. The best way to look at it is 'W0RLI AT W0RLI
which is in CA which is in USA which is in NA'. So far so good.

But the Japanese network wants to use area routing numbers. For
example, JA1ABC.42.JPN.AS ... and everyone says, 'So what, let
them!' Of course, that is very mature of all of us, but the trouble
is that the 42 in that string may also match wild-card ZIP codes
that some folks keep in their forward file, such as 42*. The
solution we propose is to use an agreed upon key character for
designators below the state and province level, and we recommend
the octothorpe, '#'.

So now the above address would be JA1ABC @ JA1KSO.#42.JPN.AS ..."

(etc.)

Hope that explains a little more fully the reasoning ...

John

I do not own a packet
although I am thinking about buying one soon, one thing you might try though is
purchasing one of the new breed of "notebook" size pc laptops. Most I have
seen come with serial and parallel ports, vga lcd, screen and a fair amount
of memory, and a 1.44mb 3.5in disk - all for between 1800-3600$. Zeos, Austin
and a few others all make IBM compatible machines with 80286 12-16hz processors
for about 2000 dolloars. Take a look in the March Computer Shopper for a run-
down on most the latest of these notebook sized machines weighing generally
less than 6lb.
                  hope you find what you're looking for,
                           Chris

Can someone offer me a hand? I am new to both the Internet, and to packet
so please bear with me. I have a PK232 and am ineterested in using the
KA9Q TCP/IP package with it. Does anyone have a basic document that they
could mail me on the proper techniques of its use? How does one obtain
their address? etc. Any help would be greatly appreciated..

     Thanks, Peter N2IFC

The ASCII "formfeed" character (12 decimal) is used as a "clear screen"
command by many terminals.

   So far, it all seems to make sense (even if about as easy to read as Attila the Hun's laundry list). Here in Australia they went a little further...

   If you look at my .sig below, you'll see the #WA between the BBS call and the abbreviation for Australia. We were told that this was necessary (rather than the much more obvious "WA" for Western Australia) because the hierarchical forwarding software would assume that it was the abbreviation for Washington state in the US because it scans the address from left to right. This leads me to conclude that either:

1. The whole hierarchical forwarding process as implemented is a kludge (like half of the rest of packet's "protocols"): why in hell should it scan left to right when it makes more sense to scan right to left? Internet domain names are scanned in this fashion. It's a bit like telling someone that he can't call himself "John Smith" because there's already a John Smith somewhere else. Or worse, that he has to call himself #Fred Bloggs because there's a Fred Bloggs in Outer Mongolia.

or

2. Someone in Australia mis-read the documentation and decided that this name change was necessary. This is probably the more likely.

Suggestions and corrections welcome.

....Ron

>   to right when it makes more sense to scan right to left?

The idea of scanning from left to right is to find the most direct route to the destination. If I was to forward a message to you, the BBS would perform the following steps :

Do I know where VK6ZJM is?
No - do I know where VK6BBS is?
No - do I know where #WA is?
No - do I know where AUS is?
Yes - forward the message in that direction.

If, on the other hand, I had a direct link to VK6BBS I would forward the message there, rather than to Australia, as VK6BBS is much closer to you

Australia in general.

The main reason for having the # before the second field is to eliminate any
problem which may arise from having a local hierarchical address which is
the same as a country or continent designator. If, for example, you had a
local address of NA (for Northern Australia, say), then the BBS would try to
send the message to North America, as that is what NA is supposed to be.

I hope this helps a bit.

That should have been `might', rather than `would', depending on how the
forwarding file was set up. The important thing is that the BBS would have
to know the difference between NA meaning Northern Australia and NA meaning
North America.

Some TNCs have a filter command that removes all non-printing characters
from the incoming stream. I don't believe the MFJ 1274 is one of them.
I think you are limited to 10 characters in your filter list. Certainly
formfeed will be one character you'll want to filter. Most nodes, and
all TCP/IP stations transmit some packets in fully binary mode so you
will often have characters on your screen in monitor mode that will
cause your terminal to do strange things. You'll need to sit down with
your terminal book and TNC manual and figure out what to kill.

The 1.1.7 tapr firmware (MFJ adds WEFAX and calls it 1.2.7) includes
a MNONAX25 ON/OFF command, to eliminate tcp/ip, netrom routing, and
other packets having a PID different from that of AX.25.

I am running the net.exe called netpc developed in Germany by
DL3DBT and group. I have it running fine on two ports with
tcp/ip and net/rom.

I need the documentation for this (in English, I hope). Many features
like NOS are handled with this program and it has color and windowing
support.

If anyone knows where I can ftp the docs please contact me. Thanks!

In proper domain-style addressing, a la the Internet, this would rather be:

Do I know where VK6ZJM.WA.AUS is? No
Do I know where WA.AUS is? No
Do I know where AUS is? Yes
Forward in direction AUS

Note that the complete tail is a part of the address. Thus, VK6ZJM.WA.AUS
could not be confused with, for example W0BBS.WA.US.NA; if my
(non-existent) system N9ITP.IL.US.NA connected it would try:

W0BBS.WA.US.NA	Not found	VK6ZJM.WA.AUS	Not found
WA.US.NA	Found -> forward	WA.AUS	Not found
		AUS	Found -> forward

See how easy it becomes?

>DUMB TERMINALS (or, 'Why is this lap-top so heavy?')

A friend of mine uses his Sharp Wizard with a pocket packet TNC. The
major problems are the screen and keyboard being smaller than standard.
Most packeteers format their messages for 80 column and this makes it
hard to read on a 40 col display. Secondly, the keyboards on these little
jewels aren't really suited to touch typing. Keyboard QSOs are slow anyway,
but having to hunt and peck on the little keyboard makes it intolerable
to me anyway. The new Wizard (the one with the QWERTY keyboard) has a
serial port that works up to 9600 baud. I don't know the baud rates
available on the BOSS series. I have another friend who has one of
these and I'll ask him. The consensus around here is that the Wizard
is a better value than the BOSS, but if you're only going to use it
as a terminal, then that probably doesn't matter.

One lightweight system I've used for portable packet is the Radio
Shack Mod 100. It suffers from the 40 col screen, but the keyboard is
decent and it has a built in terminal program. Used Mod 100s should
be lots cheaper than the BOSS or the Wizard. RCA used to make a simple
dumb terminal with a 2 line 80 col display and a full size keyboard.
These are a little smaller than a Mod 100 and I've seen them at
hamfests for $25.

Your HT should work fine on the train. I'd make a twinlead J-pole
and tape it to a window for best results. Between your terminal and
your TNC, there should be enough digital hash that I'd want to locate
the antenna a few feet from the noise. Also the extra gain of the
J-pole will help on voice too.

Do be aware that train power may not be 110 VAC 60 Hertz. So battery elimination or charging may become a problem if you don't have the proper adapters. Check this out ahead of time with your travel agent or call the train company's maintence yard and talk to their electrician.

Have fun!

As part of the multi-pronged strategy of Project SAVE THE BANDWIDTH, I will now put out a call for On-Line Elmers. These are people, who by virtue of skill and knowledge in an area of expertise in ham radio, are willing to field E-mail by readers of the rec.radio.* groups.

Volunteers need only send me their name, E-mail address, and area of expertise. "Generalists" or "Miscellaneous" Elmers are also quite welcome. Naturally, the more that volunteer, the more the work is distributed. If upon volunteering, you are unable to meet your obligations, simply write to me and I will remove your name from the list. I could also add that because of "personal committments" or "career broadening" you no longer are available to Elmer on a regular basis.

I will be the point-of-contact for this project. I will maintain the list, post it to the groups at least monthly, and have the latest copy placed in the supplemental archives at ftp.cs.buffalo.edu in subdirectory pub/ham-radio.

Here is the latest version of the list. If you sent me mail and are not on it, please resend as it may have been lost on the way or once it reached my host.

Bzzzzzt - wrong. In domain-style "addresses", names are just names, and DO NOT imply routes. There are names, addresses, and routes; it is important to keep the distinction between each of them.

Internet style names are broken into an administrative heirarchy which has (by design and absolute intent) nothing to do with routing or addresses.

If you are going to cite Internet style domain names, please don't change the meaning while you're at it.

Yes, some of us are really sensitive about this distinction.

I have been using KA9Q nos for quite a while now. I am interested in trying something else for awhile. Unforunately, I don't find NOS stable enough, or quick enough for AX25 use. I would like to have a bbs program that supports SMTP mail plus the messages come in as one file per user. Does anyone know of such a program? There is MSYS here, but it stores each message separately.

Any ideas?

could contact. No one in my Institute at the University has any ham friends, nor was I able to get much help at the US Embassy. I would appreciate anyone reading this note who knows about clubs in Mexico City responding to my e-mail address above. My dad has excellent equipment and operates on all bands of wavelength 80 meters and shorter, and belongs to at least one packet relay club. He just bought some new Kenwood digital transceiver gear (probably without my mother's knowledge) and began getting involved with computers about two years ago (at age 86!). If anyone would like to contact him directly, he operates a regular daily schedule near 3.999 MHz from 7-9 AM EST. His handle is Paul...

One more inquiry...I just found out that some links between ham clubs and Internet exist. One I know about for sure is KG6KF.ampr.org in San Jose. Does anyone know of an equivalent "node" in the Hudson Valley area of southern New York state? I sure would like to communicate with him through such a facility while I'm in Mexico. Once again, any help would be appreciated.

Paul Grant (grant@unamvm1.dgsca.unam.mx)

Just a note about the H-addressing.

The new AA4RE v2.11 BBS software DOES now search like the internet style. Eg if you have an address of,

   VK5ZWI@VK5TTY.#SA.AUS.OC

the AA4RE BBS can be set to search for,

VK5TTY.#SA.AUS.OC

#SA.AUS.OC
AUS.OC
OC

The first one that matches is the one that the mail will go to.

This means the # is no longer required. BUT I wouldnt go suggesting
it be dropped because there are still many BBS systems that dont
search that way.

Cheers de Grant VK5ZWI

    Hello All,

As I promised about two weeks ago, here is a little more detail on the N2GTE
Packet Mail Switch. I would have written back sooner, but getting the flu
caused my bed to take priority over Email :-(

Many of you on here have talked about the problems with the TCP/IP section of
the MSYS package, but here is a BBS (if you want to run a BBS) that won't have
the problems listed since it actually uses NET (from Phil - KA9Q) so everything
should work.

The BBS is a multi-user/multi-tasking system that runs inside of DesqView 2.3x
and uses DesqView like I have seen no other packaged do. To achive very good
efficiency it uses multiple windows to acomplish it's tasks, and will open and

close user and forwarding windows as needed.

Also one unique feature of the BBS is it's ability to learn new routes to other BBS systems. GTEPMS if not sure how to resolve a message, will send a request to other GTEPMS systems in the area and ask them if they know how to resolve the mail, and if so it will learn the path and add it to it's own tables.

I won't go into a big thing here on just what all the BBS will do, but will leave info below on how you can download the doc's if you desire.

Where I really like this BBS program is in it's ability to exchange mail between the BBS and NET. I a message arrives on the BBS and it is destined for an IP address (.AMPR, .AMPR.ORG, or whatever you specify), or the user is listed in the forward file. The BBS will place the message in the SPOOL\MQUEUE directory and setup the job for SMTP transfer. Also if a job arrives via SMTP and the next host can't be found in the HOSTS table (this assumes you have it set to place the unresolved jobs in RQUEUE), and the job gets placed in SPOOL\RQUEUE. The GTEPMS system will scan the RQUEUE directory and attempt to resolve the message. So if the unresolved message was for say W3XYZ @ WB3FFV.MD.USA.NA, it will accept that message and place it in the BBS for forwarding in the BBS network.

As you can see this provides a complete gateway between the BBS and TCP/IP worlds, and avoids many of the problem IP implementations in other BBS systems by actaully using NET. I personally wanted to receive the local BBS bulletins (and used the IP mbox, but it had many problems), but wasn't willing to stop running NET/NOS to do this. This BBS package (GTEPMS) has allowed me to do both, and since becoming a beta tester for Doug's code I have very much enjoyed the package.

One thing that should NOT be overlooked, this is a BIG system and requires the mimimum configuration listed below:

```
80286 based system      (The faster the better)   {386 if at all possible}
Desqview 2.3x           (QEMM-386 5.x if using a 386)
2Meg of DRAM            (4Meg if also using NET)
G8BPQ PC-Node Software  (Version 3.57 to 3.59)
GTEPMS Version 1.2      (of course :-)
```

I personally use an 80386sx-20 with 4MB of RAM to run the system, but with this configuration I can also use TC++ at the same time!

OK, so you want to know where you can get the software. The code can be downloaded from my telephone BBS, and I will once again post in a seperate message the information on how to reach my BBS. I will also try and post the files on thumper and tomcat over the next couple days when I have time to upload them, but for now it is only on the BBS.

Hopefully this will answer the questions some of you have on the BBS, and if you decided to try it I would really like to hear what you think of it as well..

I have some questions for the amateur radio IP community. I have an Arcnet LAN and have been thinking about getting a Class C IP network address for it. This would greatly simplify some projects that I am working on. However, there appear to be some pitfalls. Questions follow:

1. How many of you have Net 44 dependant routing? For an example with KA9Q, Net 44 packets are routed to a KISS serial port and everything else is routed to a campus Ethernet ultimately connected to Internet.

2. How many of you have amateur radio IP nodes with addresses outside Net 44? Have you had problems with routing as described above?

+--+

HOW TO ACCESS THE WB3FFV AMATEUR RADIO TELEPHONE BBS !!!

I have placed a BBS system on-line that is mainly oriented towards the Amateur Community (but there is other stuff on-line). As of now I have not attempted to promote this system any place except in the amateur channels (PACKET, USENET, & word of mouth), and will continue under this policy, as I hope to keep it oriented toward amateur radio. The various software for UP/DOWNload is available via telephone dialup and Packet TCP/IP, and through user support I hope to keep the latest and greatest ham software on-line. Below is the information that is needed in order to access the BBS via Telephone -or- TCP/IP, please pass it around to as many ham's as possible.

System Name: WB3FFV
User Login: bbs
Number: (301)-625-0817 -- 1200 & 2400 (Non-MNP)
Number: (301)-625-9482 -- 1200,2400,4800,9600,19200,38400 V.32 (V.42bis/MNP5)
Number: (301)-625-9663 -- 1200 & 2400 (MNP5), 9600 & 19200 (PEP)
Data Settings: 8 Bits, NO Parity, 1 Stop Bit
Times: 24hrs/365days (except for routine maintenance)
Software: XBBS (UNIX/Xenix Multiuser BBS)
IP Address: 44.60.128.1 {wb3ffv.ampr.org} [for FTP access on 145.650 mhz ONLY]
Misc. Info: Machine is an 80486 computer running UNIX V.3.2 and features 800 Meg of on-line storage. Most transfer protocols are available!!

I attempt to keep the latest and greatest HAM software on-line, and encourage all to upload anything new that they come up with, as it is of benefit to all. Here is a sample of a couple pieces of software that is available for DOWNLOAD:

KA9Q TCP/IP Software for the PC (Latest OFFICIAL release + TEST Versions)
KA9Q TCP/IP for the Atari-ST, MAC, & Amiga
KA9Q TCP/IP for UNIX based systems
KA9Q TCP/IP (The NOS release) [UNIX, MS/DOS, Amiga]
KA9Q TCP/IP (Version by G1EMM, PE1CHL, PA0GRI, Etc.)

N2GTE Packet Mail Switch [GTEPMS] (Version 1.2)
WA7MBL BBS for the PC (Versions 3.31, 4.31 & 5.1[2,3,4])
W0RLI BBS for the PC (Versions 6.xx, 7.xx, 8.xx, 9.xx, 10.xx, 11.xx)
MSYS BBS for the PC running KISS TNC's (Version 1.07-1.10)
AA4RE BBS for the PC (Version 2.10)
Various BBS utilities and enhancements
Several MORSE CODE Tutors
TheNet software by NORD><LINK (Version 1.01 & 2.06)
Modifications for many HAM Rigs and Scanners
Digital Signal Processing software (DSP)
DX and contesting programs
ARRL Newsletters & Gateway
W5YI Electronic Edition

There is much more available on the BBS, and I don't want to waste a lot of PACKET BBS space trying to list it all, so if you are interested give it a call and see for yourself !!!

If you are interested in using UUCP to connect to the BBS, this can also be done as I support Anon-uucp. The login to the system is 'uucpanon', and there is NO password. The listing of avalible archives are stored in a file called 'FILES', and it is located in the /usr/spool/uucppublic. To retrieve the files listing just use the following command:

uucp wb3ffv!~/FILES /usr/spool/uucppublic

This will move a copy of my files listing into your uucppublic directory. If you have any questions or problems, feel free to contact me at one of the numbers/adresses below. Good Luck...

>   change was necessary. This is probably the more likely.

FAR FAR more likely. :-) Browsing thru the mail on my BBS (VK1KCM) I notice South Australia and Western Australia both use the "#" at the state level while everybody else only uses it below the state. (#SA, #WA and ACT, NSW etc)

It's rare, however, for there to be any identifiers below the state level. My address here in Canberra is;
vk1kcm@vk1kcm.act.aus.oc

Also the "Asianet" sysops, mainly Brian Beamish Vk4BBS decided that we wouldn't use .au as our domain. Instead we have to use .oc (for Oceania). Needless to say none of these people are on the internet. :-(

Carl.

Hang on. It would be stupid to route only on the first match. I can't believe Internet domain routers operate by only matching the first match from right to left!

What you are saying is that EVERY segment of an address must be unique world wide. This, obviously, won't work! The higher levels in the address

MUST be taken into consideration when making a match.

Carl.

>Do I know where VK6ZJM is?
>No - do I know where VK6BBS is?
>No - do I know where #WA is?
>No - do I know where AUS is?
>Yes - forward the message in that direction.
>

It's equally true to say:

Do I know where AUS is? Yes - continue; No - warn Sysop
Do I know where #WA is? Yes - continue; No - forward using AUS
Do I know where VK6BBS is ? Yes - continue; No - forward using #WA
Do I know where VK6ZJM is ? Yes - forward, No - forward using VK6BBS

So right to left is OK, too...and is much more in line with most other mail
system algorithms (although that might not count for much!). However, with
your method, you might get the answer:

VK6ZJM - no
VK6BBS - no
#WA - yes......it's the Watsui province of Japan, so send it there.

Right to left precedence is required.

And while I'm pontificating (:-) the left most callsign (in the above examples VK6ZJM) should ONLY be considered for routing purposes if it is shown as part of the domain segment (eg VK6ZJM.VK6BBS.#WA.AUS). Once the '@' is reached in the right to left scan, routing should stop. The reason is this: the originator of the message may know that VK6ZJM has moved QTH - routing software wouldn't always know this.

I organized the Digital Suite at Stouffers last year. I'm not going to
Dayton this year. The Digital Suite was a one time thing on my part.

A friend had reserved the Orville Wright Suite the year before, then
didn't use it. He gave it to me for free, and I thought it would be
fun to gather usenet/fidonet/packet/RTTY hams for a party. It
was great fun, but NO WAY could I ever afford to do this again, at
least with my money.

I don't think it matters much which direction the @ field is scanned, the
important thing is that the closer to the left a sub-field is, the closer it
is to the person you're sending the message to. The problem comes when we
comes across a sub-field which is not unique (eg #WA could be Western
Australia or the Watsui province of Japan). The BBS somehow needs to know
that there is a #WA in Australia and another one in Japan, and at present I
don't think that's possible. What needs to be added, therefore, is some way

of allowing the BBS to forward to #WA.AUS or #WA.JAP (that's probably not right - I can't remember the country code off the top of my head).

>
I think that when someone moves the first person they tell (in the packet world) is the SYSOP of their local BBS, otherwise that BBS is going to keep trying to forward mail to them when they're not there. Being able to forward on the TO field is often very useful - remote SYSOPs often like to have mail addressed to SYSOP forwarded on to them, for example.

DIGIPEATERS AND NODES pt 2

NODES

What's a node, anyhow? How does it differ from a digipeater?

A node is something like a switchboard - that's not a very good analogy, but its close. A node takes signals from one station and "ports" those signals to another station. Sounds like a digipeater, doesnt it? In contrast to a digipeater, however, the node handles the

ACKs between itself and the stations on each end, cutting down the number of housekeeping packets going over the air. The difference is that the connect from station A to the node is one link, and the connect from the node to station B is another link. It looks like this:

```
      Station A: => Node - Node => Station B  (one link)
      Station B: => Node - Node => Station A  (second link)

      or:

      Station A <==> Node  <==> Station B
```

The arrows indicate the ACK and traffic paths. The signal goes to the node, where it is ACKed by the node to Station A. The node then sends the signal to station B, where is must be ACKed by B. If B does not ACK the packet, the node keeps sending it until it exceeds its time-out value, then it breaks the link.

How does it make it better than using a digi? Instead of 6 packets round trip, going thru the node only requires 4 packets...so traffic should, theoreticaly, be faster.

This is only one aspect of using a node versus using a digipeater. Nodes can also do other things which make them very useful critters to have around.

DIGIPEATERS AND NODES pt 3

Other features of nodes which make them very valuable, are their
ability to operate on more than one frequency and "port" signals
between them, and their ability to automatically route traffic from
```

an orginating node and a destination node many miles away.

There are many different types of nodes, and while they all do essentially the same things, there are differences in command structure and features, so I'm not going to go into commands used by nodes, except to say that they all have a "help" command, usually in the form of a question mark or "H".

The ability of a node to operate on different frequencies means that traffic can be sent to a station far away and not on the same channel. If, for example, you are a Novice, you can legally get into a BBS on 2 meters by connecting to a node on 220. Of course the node must either hear that BBS directly or hears another node which can hear the BBS...and you have to know the destination node to get there.

Nodes interconnect with each other. Its possible to connect to a node 2 or 3 hundred miles away, the traffic goes into what most people call "the network". Each node has a list in its memory of the stations it can hear directly, and those which it can hear via another node.

The garbage characters you see on the screen from time to time is a node telling other nodes on the frequency what it has available. Its possible, for example to connect to a node in Annapolis, MD and enter a connect request for a node in Richmond, VA on an entirely different frequency...all of which will be handled by the "network" based on the lists kept in each node.

One thing you must keep in mind, each "hop" over the network results in a time-bite...it takes time to get the frames through, and the more hops it has to take, the slower the flow of traffic.

If you want to connect to a distant node, you do not have to specify the routing, nor do you need to manually connect to each node which is in-between. All you need to do is tell the node to connect to the destination node (assuming it knows about it...) and the network will route the request to the destination node using the best path.

LAST, BUT NOT LEAST...

Feedback from users and sysops has been taken into account for this last (for now) part of the series. Here are some final thoughts:

Instead of beaconing your personal mailbox, put a local bulletin on your "home BBS" telling everyone you're up. If you feel that you ABSOLUTELY have to beacon, no matter WHAT anyone else says: use the "beacon AFTER X" command instead of the "Beacon EVERY X". This will let you beacon without adding to the channel loading and congestion. (If you dont know what the difference is, you should read your tnc manual.)

Choose ONE "home BBS" and stick with it. Multiple "home BBS's" just make your mail go into a ping-pong circuit.

Don't play "BBS DX'ing". Dont use the nodes tables to see how far you can go on the network by trying to connect to a network BBS. Just about all BBSs have the same bulletins on hand, so going thru a bunch of nodes to reach a certain BBS is a waste of air time and a bad use of network resources.

Dont try to download a long file from a BBS during peak traffic times. (about 2100-2300)

Make sure you use the correct Hierarchical-routing designator when addressing mail to an out-of-state BBS. (.#local.State.National, and make sure the periods are there!)

Use the right bulletin header when sending bulletins. Keep in mind your intended target audience. Dont send club meeting announcements, novice class notices, hamfest information, and other items of stricly local interest via @USA or @ALLUS.

Make absolutely certain that your messaage is legal. Its been suggested by some sysops that your only quarentee of "legalness" is to keep your bulletins STRICTLY AMATUER-RADIO RELATED! A bunch of sysops got into hot water with the FCC over a bulletin sent by a now-imfamous user which had absolutely nothing whatsoever to do with Ham Radio.

Last of all: HAVE FUN! I hope these messages have been helpful to you. If you have any questions, feel free to send them to me. If I dont know the answer right away, I'll get it from somewhere ASAP. There are lots more areas I could cover, but this series was intended to get you up and running with basic packet.

.. i logged into nic.funet.fi, and recieved the following message:

230-Local time is now Mon Feb 25 14:51:06 1991
230-This server is in Finland, Europe. Our line to USA is only 56kbits/sec.
230-When fetching to USA, think TWICE before doing it, as most of material is
230-just copied from various sources in there.
230-There are constant overload problems on our line to USA...

.. due to this, especially since it was in the middle of the day there,
I elected not to download the program at this time. Is the program already
available via ftp somewhere in USA? If so, please post, and also e-mail
me with this information. If the program is not available stateside, I will
get it from Finland and upload it wherever someone offers to let me put it.
Hopefully, we can aid them a little and keep their intercontinental traffic down
this way.

   HAVE A DAY

Has anyone ever made a connection between these two devices? The Kantronics
TNC-2400 is a 2400 bps modem designed for connection to TNC1 and TNC2 clones.
The AEA PK87/PK88 boxes are not sufficient clones of a TNC2 to support a
simple installation of the modem. I have added a DCD state-machine upgrade
to the PK87 which should solve one of the problems... but I get a
continuous bit stream from the modems RxDATA output (even with no incoming
audio, ie RxAUDIO tied to GND) which makes the state-machine think
valid data is coming in and consequently blocks the TNC from ever
transmitting.

If I force the DCD input to the TNC to FALSE, I can receive and transmit
frames correctly. But, without a proper DCD circuit, it doesn't work well
for long. However, this does prove that the NRZI input and outputs of the modem
are compatible (somewhat) with the TNC.

Any clues? A schematic of the Kantronics TNC-2400 would probably
shed some light on the problem... not available according to Kantronics.

Thanks. 73, Chris

well Phil, you will be pleased (??) to know somethings never change. I was
asked to say a few words about "all this new stuff I have been doing on
packet" at last months club meeting. After I gave a brief explanation of
what I was doing and what direction we (the local TCPIPers) were trying to
go, I opened up the floor for questions or comments. The first statement
was exactly that.

The more things change, the more they stay the same.

Yes. Use Remote2. It allows dialins to behave just like they were typing
at the console. You can even run TSRs and graphics programs on the remote
PC and they will appear on your local screen. Nice commercial package.
Another commercial package, PC Anywhere, should work too, but I haven't
tried it.

> this way.

Well, if you are doing the download, say after 9pm and before 3am EST,
you are quite "safe", I mean that the download rates are reasonably
good (up to 1-2 kbit/s), but I WOULD RECOMMEND STRONGLY THAT SOMEONE
UPLOADS THIS TO A U.S SITE. The feed is _just_ 56 kbit/s...

BAYCOM Packet Software
Could someone download the BAYCOM packet software for the IBM PC and
upload it to the SIMTEL
system ?

Thanks,

Lee Stogner, N4XBD

Greetings,

I'd like to get started in packet, and I think that the only thing I need is the
TNC.
Have an IBM PC, a radio or two (Yaesu memorizer, Kenwood TH215A) and a
considerable amount
of TCP/IP/networking experience (using wires, of course :-). I think that all I
need is
something like the AEA PK-88, but I'm not sure if I want to go with a unit that's
as
low-end as it is. I'm only interested in VHF and up packet radio, no HF, WEFAX
etc.
stuff.

What are some recommendations for a TNC for me? Is 2400 bps in use at all? Would it be
worth paying for? Will my radios handle that speed (i.e. turnaround time okay)? Would a
multimode unit get me anything? Thanks!

73,

Alan

If the new mode offers no advantage to its users, but DOES offer an
advantage to the other users of the spectrum, then clearly it is an
advantage to use this new mode, but how do you get the users to do it?

And what is this "beeeeep beep beeeeep beep ... beeeeep beeeeep beep beeeeep"
I keep hearing on the radio, anyway? It keeps messing up my screen :-)

>The big problem now is finding space for 9600 bps modems (or other,
>more efficient modems). Just try to find a spare 2m packet channel in
>the NYC/NNJ area. Even 220 and 440 aren't much easier.

This is why some places end up with coordinator wars. I still hold the position that there is NO reason to deny ANY request for a coordinated frequency. It is NOT an allocation process, it is a COORDINATION process. So coordinators should COORDINATE, not deny.

>|> In the end, if you want to cause people to migrate to new modes, you

>for us) by making spectral efficiency (rather than first come, first
>served) a prime factor in the decisions of amateur frequency
>coordinators, but I don't hold out much hope for this.

Some coordinators are trying to get the FCC to sanction specific coordinators. I would not ever want to see that happen and I susppect it never would happen because the FCC knows all the legal implications that would happen. Each and every time someone is denied a coordination there is going to be someone complaining to the FCC about it. And the complaints would be VALID!

We SHOULD be able to do the whole thing ourselves. But the first thing that will be required is to acknowledge that all interest groups and all amateurs have an equal and fair access to the spectrum. So far many major coordinators won't even attempt this.

One reason that coordinators are afraid to deal with these issues is that coordinations of the past have been perceived to be cast in stone once issued and effectively "owned" by whoever they are issued to. I've heard of them even being SOLD to another ham. When someone is told by a coordinator that they have to change frequency, location, or other parameter, they would object, perhaps rightly so in many cases. There are already cases of lawsuit threat against coordinators, and this would bring about even more.

Still, a process of "ONGOING COORDINATION" means that everyone has to always be prepared to cooperate with everone else who uses the same spectrum, at all times, and forever more. This is the basis that coordination should be all about. Each and ever holder of a coordination who expects it to be cast in stone and never changing needs learn some new ways of cooperation.

A few days ago, at the Santa Cruz Amateur Radio Club's monthly
meeting, one of the attendees was an ARRL vice-president. I'm
sorry, but I don't remember his name. I asked him about the
citations issued to the BBS operators thru whose systems the
offending posting merely passed. He said that the ARRL has
been in touch with the FCC about this, and they seem to be
holding to their original position that only the originator
of a particular message is responsible for its content. He
expects that the citations will be recalled, and the recipients
of the citations are currently sitting tight. It would appear
that this was a case of a particular engineer going off on his
own. It is expected that the FCC's position on this will be
made clear to other engineers in charge.

I hope that he is right.

You may want to sub and ask your questions to a list called Help-Net

this list is a HELP RESOURCE for questions concerning BITNET/CREN/ and
Internet

Its address is as follows

to SUB:

TELL LISTSERV@TEMPLEVM SUB HELP-NET <YOUR NAME>

with your name being your correct name

to submitt a question send to:

Help-Net@TEMPLEVM

The persons on this list will, if they can't right off, research your
questions and will reply back to the list with your answer.

This list is very informational....

Hope this helps

Original Article:
True. Of course, at 300 bps, transmission time is less, so some types
of fading and QRM might be less likely to affect Packet. I agree that
AMTOR might be more resilient to poor path conditions, though. You
make a good point.

--
James L. Paul

***** Reply:

You bet Amtor is more resiliant! I have seen stuff go through
even when you can hardly hear the station! It's a super mode!

Write a short article DESCRIBING those advantages that we can
upload to local packet bulletin boards. I have used NET or NOS
for a couple of years now, and love it, but _I_ don't know what
to say to the AX.25 users who ask me "Why?", and I'
d sure like to have a well-reasoned answer to give out.

Hi

I saw a posting on this group about a fortnight ago saying that
the new version of the kiss code v1.1.8 I think fixed the slow
(12 bytes /sec) problem in ftp transfers using TCPIP, if this
is true is the new code ftp'able from somewhere, if not where
can I get a copy and am I correct in what I read????

Thanks

Hi. I have a friend who is curious whether or not it is possible to do TCP/IP and UUCP via HAM radios. He lives in Singapore (where network access and phone calls to USA are EXPENSIVE!!). What he's interested in doing is getting a HAM radio, and using it for TCP/IP and UUCP. Am I making any sense? Can anybody help? Please be verbose, as I know nothing of HAM radio.

Thanks, Ralph

Here is the information I recently promised to provide:

You are welcome to solicit and generate messages to U.S. Military personnel in any branch of Service. These messages may be from you, friends, neighbors, business associates - ANYONE!

Use the following message format:

```
FM JANE DOE/WD0GNK    [Mess is from Jane Doe and entered by WD0GNK ham station
                       Do not put spaces before or after slant (/) bar.
TO BEMY SWEATHEART    [Name of person the message is going to]
473-00-1234           [Service or Social Security Number]
14TH SOLID WASTE      [Unit and other mailing address info - up to 2 lines]
72ND FOXHOLE          [Second line of address]
APO NY 09732          [APO or FPO must be included plus 5-digit number]
GR 26                 [Number of words in message including signature.  The
                       count must NOT exceed 35 words - number groups, UNCLAS,
                       and SGD count as words.]
BT                    [Break]
UNCLAS                [Indicates message is unclassified - all must be!]
HI HONEY I AM NOW     [To make message easier to count put 10 words per line
I HOPE TO GET A       if possible; don't use punctuation or "x-ray"
LOTS OF LETTERS SOON
I MISS YOU NIGHT AND DAY
ALL MY LOVE SGD JANE  [SGD is abbreviation for signed and included in grp ct.]
BT                    [Break]
                      [Allow 2 blank lines between last BT and NNNNs]

NNNN                  [Include 4 uppercase Ns 2 blank lines after last BT]
                      [Allow 1 blank line between NNNN and next message]
```

SAMPLE MESSAGE:

```
FM LOWELL MONTGOMERY/KB0FFO
TO 1ST LT ZIGGY STRIP
432-75-1602
HSC 844TH ENGINEER BN
APO NY 09657
GR 27
BT
UNCLAS
MISS YOU A LOT  THERE WILL BE A BIG PARTY
WHEN YOU COME HOME BOWSER MISSES YOU KEEP
HEAD DOWN AND SPIRITS UP SGD LOWELL
BT

NNNN
```

SO THATS ALL THERE IS TO IT! THE ENTIRE MESSAGE MUST BE IN UPPER-CASE.
Messages should be delivered in 4-8 days for APOs and 9-12 days for FPOs. Feel
free to promote messaging to KSA and send as many as you can! Send your
messages to me at: estey@skyler.mavd.honeywell.com

  Hello all FBB software users,

A mistake was done in the 5.12 distribution. The example of EPURMESS.INI file
is not correct, as the Binary Mail directory is missing. Please correct this.

```
# definiion des parametres de l'epuration des messages.
#
# Directory fichiers messages
\MAIL\
#
# Directory fichiers messages binaires
\BINMAIL\                                   <-- Line missing
#                                           ================
# Directory archive messages
\OLDMAIL\
```

The file is well discribed in the documentation.

I apologize for doing this mistake. Best 73 from Jean-Paul, F6FBB.

The latest code from TAPR is 1.1.7b, and I'll be putting a binary image on
the machine col.hp.com sometime in the next couple days... we voted at the
board meeting last Friday to once again allow instant FTP and BBS availability
of TNC-2 firmware upgrades as soon as they are available...

I have not heard of a 1.1.8 yet.

Hello.

I am looking for address/telephone details for a company who supplies a LAWN interface unit (local-area wireless network) that connects to the serial port of a PC.

The name of the company is: O'Neill Communications (Princeton, NJ).

An article in June 1990 Byte on wireless LANs mentioned this company but gave no further details on their whereabouts.

Thanks for any help.

John (VK3DWT).

(Sorry for the cross-posting) :-)

O'Neill Communications
100 Thanet Circle
Princeton, NJ 08540
(609) 924-1095

I'm not affiliated with O'Neill, I'm just tracking developments in wireless LANs. This is by no means the only one.

If you're looking for a wireless ethernet-like network, I'm afraid this one will disappoint you. The information I have indicates the software included provides support for file transfer and email. No mention is made of file sharing or a Novell driver.

See also:

LAN Magazine, September '90, pg 100 (LAWN and others)

LAN Times, October 22, '90, pg 23 (NCR WaveLan and others)

LAN Magazine, November, '90, pg 20 (Motorola's 18GHz ethernet "repeaters")

I'd like to take this opportunity to solicit leads on other wireless LAN technologies. I'm interested in all kinds, but especially general purpose "802.x-like" technologies.

Well your friend can do TCP/IP on ham radio but there are a bunch of provisos.
The major proviso is that he must be a licensed ham. The next is that the
use of Amateur radio, in general, may not be for the purpose of replacing
a common carrier such as the phone company. Third, you may not conduct
business on ham radio.

Your friend may have another important problem. What's the status of Singapore
in terms of third party agreements? Someone out there in a position to know?

I am currently running a program that allows TCP/IP over the radio. I live
in Vancouver, WA and have been able to telnet and ftp as far south as Northern
California and as far east as Montana. At the present time, the networks that
I am aware of can only do 1200 baud. This makes it virtually impossible to
get anything meaningful done over a great distance. TCP/IP is in its
early stages right now with amateur radio. I feel that long distance
communication is just right around the corner

73 Eric N7CHR

Packet Radio: n7chr@n7chr.ampr.org Internet: erich@hp-vcd.vcd.hp.com

P.S. Currently all amateur radio is running under Net 44 and Net 44 doesn't have connections to the internet, or UUCP that I am aware of.

I would like information on working the microsat packet birds using non-directional antennas. I would like to hear from those who have worked the microsats with such antennas. What kind of success have you had? What power was used? How much data have you been able to upload or download? Any other information would be appreciated.

Howdy:

I wish to apologize for all the trouble and confusion I caused with the code in TAPR 1.1.7. 1.1.6 had KISS code in it that would not work in full duplex. A couple of years before this came out, Phil Karn and I were trying to get full duplex KISS working as we were doing TCP-IP experiments on 2 meters. I hacked at the KISS code to make full duplex work and at that time, broke the ability to turn full duplex off in the KISS code. I sent a copy of this code to Mike Chepponis and he and I both lost the source ;-(. I had a ROM image of it and sent that to TAPR after Microsats went up and many were complaining that the KISS in 1.1.6 would not work on full duplex. This code got put into 1.1.7. I forgot that I broke the full duplex off in my hurry to get full duplex working. Following the discovery (my HUNDREDS ;-( ) that this KISS was broken and causing major headaches (it ignores other signals on the channel), A Japanese ham and I fixed the code up (I apologize for forgetting his call) and I sent it to TAPR. Howie has either used this or code he wrote on his own to fix the problem.   My only excuse for all this confusion is that I was preoccupied as THE ONLY command station in the world with an understanding of the entire system in four spacecraft and was working with one other person, who was the only person in the world who understood all of the software on board and we were working about 20 hours a day for AMSAT during that time. I apologize for the problems this caused.

Hi. I am trying to set up a TCP/IP packet station at a local ham club. I
am encountering some problems which maybe others have seen before and any
solutions would be greatly appreciated.

1. NOS is running. mail and telnet have been "started". Now I go home,

and

and try to connect using "connect ax0 WA2ZXS". Connection happend, but there is nothing there! How can I set up a simple mailer (or ANYTHING) so that when people connect using ax25 (ie, no tcpip capability) there is something there?

2. Same for telnet. what good is it if I cannot do anything with it. How can I interface applications to it? Right now, it just sits there doing nothing.

3. I was running FTP and it worked was a dog for file transfers. There is way too much waiting around -- especially if it has to retry!

any suggestions?

4. I would like to make the station useful for club member
s to pass mail among themselves and any other IP nodes (limited now to ampr.org). How can I promote TCPIP when it is so user-unfriendly?

5. It seems possible to uses a NETROM interface. So I experimented with that too. Again, users get shortchanged. Ask it for anything and it does not respond.

6. I just spoke to one of the TCPIP experts I know, and he mentioned that he uses NOS, but didn't change "AUTOEXEC.NET" TO AUTOEXEC.NOS". I have both files in my main directory. I wonder if NOS is looking at AUTOEXEC.NET first? Anybody know?

Thanks in Advance. I know there are many experts who read this group, so any help would be greatly appreciated.

This morning I had a talk with a tech type at Heathkit. I've
been interested in a small, low-power TNC for use with my new
HT (an Alinco DJ-560 2m/70cm unit; for those who advised me on
that purchase, I'll post my comments sometime in the future to
rec.radio.amateur.misc -- thanx for the advice, all). The
HK-21 is ideal in most ways, being about the size of a pack
of smokes, takes very little power (40mA off an external supply,
less off an internal battery pack and/or with the LEDs turned
off), and runs at 1200 baud. The major drawback, which is a
show-stopper for me, is that it doesn't do KISS mode.

A guy who did a dump of the ROM noted that there's a copyright
message mentioning an N2WX. Heath just repackaged this TNC,
which I think is made in Japan, but apparently the code was
written by a US ham. It's supposed to be TNC-2 compatible,
and the CPU is a CMOS clone of a Z-80, apparently. Does
anyone know if I can get a replacement ROM that will do KISS
mode, or will I have to reverse engineer the bloody thing and
hack its code if I want to use it for TCP/IP?

Thanx for any leads.

|> I read about '9600 RSM'... what is it?

"RSM" stands for "rectangular spectrum modulation". It was invented by
Karl Meinzer, DJ4ZC, of AMSAT Phase III fame.

RSM is actually a misnomer - it is nothing more than PSK (either
binary or quadrature) along with some clever analog hardware to shape

the signal pulses in order to make the signal spectrum more
rectangular.

It's nothing that you can't now do much more easily in DSP, but Karl
got his hardware implementation patented and he needed to come up with
a fancy name for marketing purposes.

Hi There. Recently there has been some publicity given to the
new BayCom Packet terminal program for the PC (PC version of
the C64 digicom). I have just received a copy via ftp and have
been trying to use it but run into a difficulty.

The problem is that it does not seem to want to accept callsigns
beginning with a "V" eg VK5ZWI etc. It truncates them to K5ZWI
instead. I am at a loss to explain this. I have gone back to
my original copy a number of times and re-edited the config
file and still no go. It also wont accept digipeater callsigns
beginning with a "V".

Am I doing something wrong or is there a definite problem with
BayCom?

Please if anyone else has tried this program and had similar difficulties
when entering callsigns with a "V" as the first letter could
they let me know or at least could someone tell me if I am doing
something wrong?

Thanks in advance. Grant VK5ZWI

P.S. I wont have email access to the net till late next week. After
then I should be either,

e3grwill@snap.adelaide.edu.au csgrwill@medusa.adelaide.edu.au (AARNet)
e3grwill@snap.ua.oz.au csgrwill@medusa.ua.oz.au (ACSnet)

If these dont work try xtasc@lv.sait.edu.au and add a covering note
to Rob Mayfield asking him to pass this to me on Packet Radio.
My Packet Radio address is VK5ZWI@VK5TTY.#SA.AUS.OC.

Or as a last resort try usenet.

Cheers de Grant VK5ZWI - Adelaide, South Australia - SysOp @ ADELAN BBS Network

Date: 8 Mar 91 00:46:46 GMT
Lines: 84
Xref: gmdzi rec.radio.amateur.misc:443 rec.radio.amateur.packet:92

Project SAVE THE BANDWIDTH emerged as a result of informal E-mail
discussion among a few of the "veteran" readers of the rec.ham-radio
(now rec.radio.amateur) newsgroups.

Some of the ongoing small problems we noticed were:

1. Lots of repeated entry-level questions (what is ham? how do I
become one? etc.).

2. Lots of repeated mid-level questions (where are the ftp sites?
where are the telnettable callbook sites? etc.).

3. Lots of postings to the wrong newsgroups (misc in packet, packet
in misc, swap in misc, etc.)

The best solution to problems 1 and 2 would be a Most Frequently Asked
Questions list. Most of the comp.* groups have such a list and it
keeps down the number of "what is an autoexec.bat file?" postings.

Diana Syriac, KC1SP, has graciously volunteered to put such a list together. She welcomes additions and corrections to the list, which should be sent to dls@genrad.com.

Since he was the person who brainstormed the ham-radio newsgroup reorganization, Jay Maynard K5ZC (jmaynard@thesis1.hsch.utexas.edu), has agreed to tackle #3. He will be periodically posting a regular rec.radio.* group overview describing each group and what should and should not be posted to each one.

Another useful resource would be a supplemental ftp site for filing the above postings. There are a number of good ham-radio archives, including wsmr-simtel20.army.mil and wuarchive.wustl.edu. Our purpose is not to take the place of these archives, but merely to make available documents that are of enough long-term and widespread interest to provide a storage site for, but not important enough to justify trying to get it on the larger sites (e.g. the New Packeteers Guide by KA3RFE that I got almost 30 E-mail requests for). As an example, we can look at the comp.dcom.telecom newsgroup. In addition to archived newsgroup postings, the comp.dcom.telecom archives on lcs.mit.edu has quite a few informational documents such as telecommunications regulations, glossaries of terms, and such. Since rec.radio.amateur.misc and rec.radio.amateur.packet are already archived elsewhere, what would be desirable is a "supplemental" archive for these informational documents. Some of these documents include:

1. A list of Volunteer Examiner Coordinators (VEC's)

2. The most recent copies of KC1SP's, K5ZC's, and other's informational postings.

3. The KA3RFE New Packeteers Guide

Devon Bowen KA2NRC (bowen@cs.buffalo.edu) has set aside some space on ftp.cs.buffalo.edu in subdirectory pub/ham-radio for just this purpose. Submissions for the archives should be E-mailed to him.

Our final (and probably most ambitious) project is to compile a list of On-Line Elmers. These are individuals who regularly read the newsgroups, have some expertise in some area of the hobby, and are willing to field questions (either via E-mail or on the newsgroups) in that area of expertise.

I will be the point-of-contact for the On-Line Elmer's project. Naturally, the more volunteers we have, the more evenly the work is spread. If after volunteering, you would like to withdraw, I would certainly remove your name from the list. I could also add some sort of notice saying that because of "other committments" or "career broadening" you are no longer available for full-time Elmering, if you wish.

Naturally, we don't intend to be *THE* set of informational postings,

just *A* set of informational postings. Feel free to either send
information to us, or post it yourself. The advantage of sending it
to us is that it gets incorporated into our FTP files and
informational postings.

Comments/criticisms are welcome.

73, Paul W. Schleck, KD3FU

Yes! after the long long wait, the AA4RE mailbox BB V2.11 is now
available. Significant new features:

* Sorting of messages to be forwarded by type, size, age, etc
* Forwarding control based on message size, path, and time
* Forward aging (Eg: don't try second system until so many hours have passed)
* Added SYSOP action file
  - Hold or reject incoming messages based on many factors
  - Make a file from a message automatically
  - Control over user originated message based on class, address, etc
    (Eg. No more SP ALL @ ALLUS)
  - Ability to automatically kill messages that are superseded
    (Eg. AMSAT orbital data)
* Route messages to ? and the corresponding L? command to find bad addresses
* Multiple language support
* Emergency Mode for ARES/RACES support. This is an implementation of
  the recommendations of the ARES/RACES/NTS meetings following the
  Oct 89 Northern California Earthquake

The are also a lot of minor improvements and fixes.

You can get this program by sending $5 US (or equivalent) to:

  Dave Larton, N6JQJ

766 El Cerrito Way, #D
Gilroy, CA 95020-4149
(408) 847-3605

John Anderson, N7IJI
2729 Park Road
Charlotte, NC 28209
(704)-333-3249

Canadians can send 5.00 CDN to:

A.R.E.S. Group
Att: REBBS Update
P.O. Box 35
St-Jean Chrysostome,
Quebec, Canada   G6Z 2L3

For source code, include $2 more (needs multiple diskettes). Indicate which format diskette you need. We can handle all formats of 5 1/4 and 3 1/2 inch diskettes Don't include diskette or mailer, we will supply.

The software can also be obtained by downloading from the following BBS:

WA6RDH BBS -- 916-678-1535 -- 300/1200/2400/4800/9600 N81 V.32/MNP5
WB3FFV BBS -- 301-625-0817 -- 1200 & 2400 (Non-MNP)
-- 301-625-9482 -- 1200, 2400, 4800 & 9600 V.32/V.42/MNP5
-- 301-625-9663 -- 1200, 2400, 9600 & 19200 (PEP)

The software is also loaded onto the W3IWI TOMCAT TCPIP server accessible via both SLIP and thru the Internet.

BITNET users can receive the code direct from me. Drop me a line at ENGE at ALMADEN.

Sorry this version took so long but I think you will be happy with it.

Roy, AA4RE

Hi,

Who all is planning to go to Dayton this year? War's over, travel is probably
getting safer again, economy may rebound....

Also, will there be another gathering of the "Digital Suite" at the Stouffer
and if so, same place, same day (Friday) and time?

Thanks,

Mark.

It is a known bug, and the authors are working on it (so I'm told by the UK
distributor).
